

## NOVEL POLYPEPTIDES INVOLVED IN IMMUNE RESPONSE

Ins 2

This application is a continuation-in-part of international application Serial No. PCT/US00/01871, filed January 27, 2000, which is a continuation-in-part of application Serial No. 09/264,527, filed March 8, 1999, which is a continuation-in-part of application Serial No. 09/244,448, filed February 3, 1999, which are hereby incorporated by reference.

Field of the Invention

The present invention relates to polypeptides that are involved in T-lymphocyte activation. Specifically, the invention relates to T-lymphocyte costimulatory polypeptides, the nucleic acids encoding the polypeptides, expression vectors and host cells for production of the polypeptides, and compositions and methods for the treatment of diseases related to immunosuppression and immune activation.

Background of the invention

For the generation of a proper T-lymphocyte (T-cell) immune response, two signals must be provided to the T-cell by antigen presenting cells (APC). First, antigen must be presented to the T-cell receptor (TCR) via a major histocompatibility complex (MHC), in an event that determines specificity. Second, an antigen-independent, costimulatory signal must be delivered by engagement of members of the B7 family on the APC with the CD28 protein on T-cells. A productive immune response leads to proliferation, differentiation, clonal expansion, and effect or function. In the absence of the second, costimulatory signal, T-cells undergo a state of long-lasting antigen-specific unresponsiveness, termed anergy.

## Summary of the Invention

35

unique costimulatory pathway which appears to be distinct from the pathway consisting of previously described proteins CD28, CTLA-4, B7.1, and B7.2. The polypeptides are referred to as CD28 related protein-1, or CRP1, and B7 related protein-1, or B7RP1.

The invention provides for nucleic acid molecules encoding CRP1 and B7RP1 polypeptides and related polypeptides. An isolated nucleic acid molecule of the invention comprises a nucleotide sequence selected from the group consisting of:

- a) the nucleotide sequence as set forth in Figure 1A (SEQ ID NO:1);
- b) the nucleotide sequence encoding the polypeptide from residues 1-200 or from residues 21-200 as set forth in Figure 1A (SEQ ID NO:1);
- c) a nucleotide sequence encoding a polypeptide that is at least about 70 percent identical to the polypeptide as set forth in Figure 1A (SEQ ID NO: 1);
- d) a naturally occurring allelic variant or alternate splice variant of any of (a), (b) or (c );
- e) a nucleotide sequence complementary to any of (a), (b) or (c );
- f) a nucleotide sequence of (b), (c ) or (d) encoding a polypeptide fragment of at least about 25, 50, 75, 100, or greater than 100 amino acid residues;
- g) a nucleotide sequence of (a), (b) or (c ) comprising a fragment of at least about 10, 15, 20, 25, 50, 75, 100, or greater than 100 nucleotides; and
- h) a nucleotide sequence which hybridizes under stringent conditions to any of (a)-(g).

Also provided by the invention is an isolated nucleic acid molecule comprising a nucleotide sequence selected from the group consisting of:

a) the nucleotide sequence as set forth in Figure 2A (SEQ ID NO: 6) or Figure 3A (SEQ ID NO:11) or Figure 12A (SEQ ID NO: 16);

~~set~~  
5 b) the nucleotide sequence encoding the polypeptide as set forth in Figure 2A (SEQ ID NO: 6) from residues 1-322 or from residues 47-322 or as set forth in Figure 3A (SEQ ID NO:11) from residues 1-288 or from residues 19-288, 20-288, 21-288, 22-288, 24-288, or 28-288; or as set forth in Figure 12A from  
10 residues 1-302 or from residues 19-302, 20-302, 21-302, 22-302, 24-302 or 28-302;

c) a nucleotide sequence encoding a polypeptide that is at least about 70 percent identical to the polypeptide as set forth in Figure 2A (SEQ ID  
15 NO: 6) or Figure 3A (SEQ ID NO: 11) or Figure 12A (SEQ ID NO: 16);

d) a naturally occurring allelic variant or alternate splice variant of any of (a), (b) or (c );

e) a nucleotide sequence complementary to any  
20 of (a), (b) or (c );

f) a nucleotide sequence of (b), (c ) or (d) encoding a polypeptide fragment of at least about 25, 50, 75, 100, or greater than 100 amino acid residues;

g) a nucleotide sequence of (a), (b) or (c )  
25 comprising a fragment of at least about 10, 15, 20, 25, 50, 75, 100, or greater than 100 nucleotides; and

h) a nucleotide sequence which hybridizes under stringent conditions to any of (a)-(g).

30 The subject matter of the invention also relates to CRP1 and B7RP1 polypeptides and related polypeptides. The invention provides for an isolated polypeptide comprising the amino acid sequence selected from the group consisting of:

35 a) the amino acid sequence as set forth in Figure 1A (SEQ ID NO:2);

09728420-142800

b) the mature amino acid sequence as set forth in Figure 1A (SEQ ID NO:2) comprising a mature amino terminus at residue 21;

5 c) a fragment of the amino acid sequence set forth in Figure 1A (SEQ ID NO: 2) comprising at least about 25, 50, 75, 100, or greater than 100 amino acid residues;

d) an ortholog of (a), (b) or (c ); and

10 e) an allelic variant or alternative splice variant of (a), (b) or (d).

Also in accordance with the invention is an isolated polypeptide comprising the amino acid sequence selected from the group consisting of:

15 a) the amino acid sequence as set forth in Figure 2A (SEQ ID NO: 7) or Figure 3A (SEQ ID NO:12) or Figure 12A (SEQ ID NO: 17);

b) the mature amino acid sequence as set forth in Figure 2A (SEQ ID NO: 7) comprising a mature amino terminus at residues 47 or Figure 3A (SEQ ID NO:12) comprising a mature amino terminus at any of residues 19, 20, 21, 22, 24 or 28 or Figure 12A (SEQ ID NO: 17) comprising a mature amino terminus at any of residues 19, 20, 21, 22, 24, or 28;

25 c) a fragment of the amino acid sequence set forth in Figure 2A (SEQ ID NO: 7) or Figure 3A (SEQ ID NO: 12) or Figure 12A (SEQ ID NO: 17) comprising at least about 25, 50, 75, 100, or greater than 100 amino acid residues;

30 d) an ortholog of (a), (b) or (c ); and

e) an allelic variant or alternative splice variant of (a), (b), (c) or (d).

Also encompassed by the invention are  
35 expression vectors and host cells for production of the polypeptides, antibodies which bind to CRP1 and B7RP1

09/28/2016 12:00

polypeptides and to related polypeptides, and assays for detecting binding of B7RP1 and B7RP1-related polypeptides to CRP1 and CRP1-related polypeptides.

Pharmaceutical compositions comprising CRP1 or

5 CRP1-related polypeptides and B7RP1 or B7RP1-related polypeptides are also encompassed by the invention.

Methods for identifying compounds that interact with CRP1 or B7RP1 are also provided as are assays for determining whether such compounds are agonists or

10 antagonists of CRP1 and B7RP1 activity.

CRP1 and B7RP1 polypeptides are involved in T-cell costimulation and proliferation. CRP1 and B7RP1 polypeptides, selective binding agents thereof, and agonists and antagonists thereof, may be useful for the diagnosis, prevention and treatment of diseases related to the control of T-cell responses.

15 CRP1 and B7RP1 polypeptides, selective binding agents thereof, and agonists and antagonists thereof, may be useful for the diagnosis, prevention and treatment of immune disorders, either for stimulating insufficient immune response or reducing or inhibiting an exaggerated or inappropriate immune response. The immune disorder may be mediated directly or indirectly by T-cells.

25 The invention provides for treating, preventing, or ameliorating a T-cell mediated disorder comprising administering to an animal a CRP1 or B7RP1 polypeptide. The invention also provides for a method of diagnosing a T-cell mediated disorder or a susceptibility to a T-cell mediated disorder in an animal comprising determining the presence or amount of expression of a CRP1 or B7RP1 polypeptide; and diagnosing a T-cell mediated disorder or a susceptibility to a T-cell mediated disorder based on the presence or amount of expression of the polypeptide. Typically, a T-cell mediated disorder is

30

35

0923420 11300  
00321 02482460

an immune disorder which may be mediated directly or indirectly by T-cells. The animal is preferably a mammal and more preferably a human. The invention also provides for a method of identifying a test molecule which binds to a CRP1 or B7RP1 polypeptide comprising contacting the polypeptide with a test compound and determining the extent of binding of the polypeptide to the test compound. The method may be used to identify agonists and antagonists of CRP1 and/or B7RP1 polypeptide.

Antagonists of CRP1 and/or B7RP1 polypeptides may be used as immunosuppressive agents for many indications, including autoimmune disorders (such as rheumatoid arthritis, psoriasis, multiple sclerosis, diabetes, and systemic lupus erythematosus), toxic shock syndrome, bone marrow and organ transplantation, inflammatory bowel disease, allosensitization due to blood transfusions, and the treatment of graft vs. host disease. In addition, antagonists may be used as inhibitory agents for T-cell dependent B-cell mediated indications including asthma and allergy, and antibody mediated autoimmunity. Agonists of the CRP1 and/or B7RP1 polypeptides may be useful in, but not restricted to, T-cell activation for tumor surveillance and removal.

An antagonist of the invention includes an antibody, or fragment thereof, which is reactive with or binds to B7RP1 or to an extracellular domain of B7RP1 wherein the antibody reduces or eliminates the binding to B7RP1 to CRP1. In one embodiment, the antibody binds selectively to human B7RP1 or to an extracellular domain thereof. The antibody or fragment thereof which is an antagonist inhibits partially or completely the immune costimulatory activity of B7RP1. In a preferred embodiment, the antibody is a monoclonal

antibody and may be murine, human, chimeric or humanized.

The invention further provides for a method of regulating the interaction of B7RP1 with CRP1 comprising administering to an animal a selective binding agent of CRP1 or a selective binding agent of B7RP1 or both. In one embodiment, the selective binding agent is an antibody which binds to B7RP1 and reduces or eliminates the binding to B7RP1 to CRP1. The invention also provides a method of regulating immune costimulation mediated by B7RP1 comprising administering to an animal a selective binding agent of B7RP1. The selective binding agent is preferably an antibody which binds to B7RP1 and partially or completely inhibits immune costimulation mediated by B7RP1.

The invention also provides for a method of regulating T-cell activation or proliferation in an animal comprising administering to the animal a nucleic acid molecule encoding a CRP1 or B7RP1 polypeptide. For example, a nucleic acid molecule encoding a B7RP1 polypeptide may be used in gene therapy to enhance T-cell activation in response to various tumors.

Also encompassed by the invention is a transgenic non-human mammal comprising a nucleic acid molecule encoding a CRP1 or B7RP1 polypeptide. The CRP1 or B7RP1 nucleic acids are introduced into the mammal in a manner that allows expression and increased circulation levels of CRP1 or B7RP1 polypeptides. The transgenic non-human mammal is preferably a rodent, and more preferably a mouse or a rat.

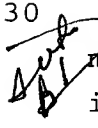

A method for stimulating or enhancing an immune response comprising administering B7RP1 or CRP1, or a B7RP1 agonist or CRP1 agonist is also provided. Optionally, an immune response may be stimulated or enhanced by further administering one or more other

00827 0248260

immune stimulating molecules, such as a CD28 agonist, a CTLA4 antagonist, or molecules such as B7.1 and/or B7.2.

Also provided by the invention is a method of regulating IgE production comprising administering B7RP1 or CRP1, or a combination thereof, a B7RP1 agonist or a CRP1 agonist, or a combination thereof, or a B7RP1 antagonist or a CRP1 antagonist, or a combination thereof. For example, administration of B7RP1 or a combination of B7RP1 and a CRP1 agonist would increase IgE production and would be useful for stimulating an insufficient IgE-mediated immune response. Administration of a B7RP1 antagonist or a CRP1 antagonist, or a combination thereof, would decrease IgE production and would be useful for inhibiting an exaggerated or inappropriate IgE-mediated immune response. In one embodiment, IgE production is partially or completely inhibited by administration of a B7RP1 antagonist, or a CRP1 antagonist, or a combination thereof. In another embodiment, the invention provides for a method of preventing and/or treating an IgE-mediated disorder comprising administering a B7RP1 antagonist, or a CRP1 antagonist, or a combination thereof. IgE-mediated disorders include those characterized by excessive IgE production, such as asthma, allergic disorders, hypersensitivity and sinus inflammation.

Figure 3. A) Structure and sequence of the protein coding region of the putative human B7RP1 (hB7RP1). Predicted signal sequence of hB7RP1 is underlined at the amino-terminus. Predicted signal peptide cleavage sites are marked by asterisks. Predicted transmembrane sequence is underlined toward the carboxy-terminus. B) Amino acid alignment of the putative mature hB7RP1 protein with the mature murine B7RP1 (mB7RP1) protein.

Figure 4. A) Expression of soluble CRP1-Fc fusion protein from 293T-cells transfected with the pcDNA3/CRP1-Fc. Normalized volumes of cell lysate or conditioned medium were loaded and separated on a 10% PAGE gel as indicated. Western analysis of cell lysate and cell media supernatant for expression of cell-associated (cell lysate) and secreted (media) Fc fusion proteins. Primary antibody was Goat-anti human Fc antibody (Pierce Chemical Company, Rockford, IL.). B) Expression of soluble B7RP1-Fc fusion protein from 293T-cells transfected with the pcDNA3/ B7RP1-Fc. 20 µl of normalized cell lysate or media supernatant were loaded and separated on a 10% PAGE gel. Western analysis was conducted as in (A).

009738420.11300

Figure 5. Interaction of CRP1-Fc and B7RP1-Fc fusion proteins with membrane-bound proteins expressed in COS-7 cells. COS-7 cells transiently transfected with pcDNA3/CRP1, pcDNA3/B7RP1, or pcDNA3 vector alone. CHO D-cells were transfected with psDR $\alpha$ /hCD28 and stably expressed human CD28 (hCD28). Cells expressing membrane-bound CRP1, B7RP1, or hCD28, are represented in rows as indicated at the left side of the panel. Fc fusion proteins were incubated with the plate-bound cells in columns as indicated at the top of the panel. After incubation, cells were washed, and bound Fc fusion proteins were detected using an anti-human Fc antibody and ACAS (Adherent Cell Analysis and Sorting; ACAS Ultima, Meridian Instruments, Inc., Okemos, MI) analysis.

Figure 6. FACS (Fluorescence-Activated Cell Sorter) analysis of expression of the receptor for B7RP1 (putatively, CRP1) on activated CD4+ and CD8+ T-cells. Mouse splenocytes were activated with PMA and ionomycin for 12 hours. B7RP1-Fc fusion protein, control Fc protein (Mock-Fc), or PBS (no stain), were incubated with the cells, washed, and subsequently incubated with goat-anti-human Fc-FITC conjugated antibody (GaHuFc-FITC) as indicated at the bottom of each panel. Cell marker antibodies (for T-cell markers CD4 and CD8) PE conjugated, or isotype control antibody (rat isotype) PE conjugated, or PBS (no stain), were added as indicated at the left side of each individual panel.

Figure 7. FACS (Fluorescence-Activated Cell Sorter) analysis of the expression of B7RP1 on B-cells. Fluorocytometric analysis of the expression of the

ligand for CRP1 (presumably, B7RP1) on mouse splenocytes. CRP1-Fc fusion protein, control Fc protein (Mock-Fc), or PBS (no stain), were incubated with the cells, washed, and subsequently incubated with  
5 goat-anti-human Fc-FITC conjugated antibody (GaHuFc-FITC) as indicated at the bottom of each panel. PE conjugated cell marker antibody to CD45R (CD45R is a B-cell marker) or isotype control antibody (rat isotype), or PBS (no stain), were added as indicated at  
10 the left side of each individual panel.

Figure 8. FACS analysis of the expression of mCRP1 ligand on peritoneal macrophages. Peritoneal cells were first distinguished in subsets on the ground  
15 of their light scattering properties (panel A). Macrophages were identified in region 5 (R5) because of their ability to strongly scatter light forward (FSC) and sideways (SSC) and because of their positive staining for the F4/80 antigen, a marker for  
20 macrophages (panel B). Macrophages in region 6 (R6) were singled out on the basis of their less intense staining for the F4/80 antigen and found to be stained by the CRP1-Fc fusion protein (presumably because of their expression of B7RP1).

Figure 9. Inhibition of T-cell proliferation using a B7RP1-Fc fusion protein. T-cells from mouse splenocytes were activated by increasing concentrations of Concanavalin A (Con A) as indicated at the bottom of  
30 the graph. mCRP1-Fc, mB7RP1, and mB7.2-Fc fusion proteins were added to enriched T-cells from splenocytes in the absence (no adds) or presence of Con A. 200,000 cells were used in the T-cell proliferation assays in a 96-well plate. Cells were incubated with  
35 media (no adds) or Fc fusion proteins as indicated in the graph legend. After 42 hr, cells were pulsed with

H-thymidine for 6 hr, then harvested and incorporated radioactivity determined. Average CPM and standard deviation from triplicate samples are represented.

Figure 11. A) Normal mesenteric lymph node from control Mouse #5 showing the cortex, paracortex and medulla of the node. Hematoxylin-eosin (H&E) stain, 40x magnification. B) Markedly enlarged mesenteric lymph node from WX11 Mouse #33 with prominent follicular hyperplasia (*top*: rows of secondary follicles in the outer cortex), expansion of the paracortex (*center*) and medullary cord hyperplasia (*bottom*). H&E, 40x. C) Immunohistochemical staining of the mesenteric lymph node from control Mouse #10 with anti-B220 antibody (B cell marker). Note the intensely (brown) staining cortical area and thin medullary cords. Immunostaining performed using the avidin-biotin complex (ABC) immunoperoxidase method (DAB chromogen, hematoxylin counterstain), 40x. D) Immunohistochemical staining of the mesenteric lymph node from WX11 Mouse #33 with anti-B220 antibody. Note the intensely staining cortical follicles and medullary cords (although the mature plasma cells in the cords are negative for B220), 40x. E) Immunohistochemical staining of the lymph node from control Mouse #10 with anti-CD3 antibody (T-cell marker). Note the immunostaining of the paracortical zone of the node, 40x. F) Immunohistochemical staining of the lymph node from WX11 Mouse #33 with anti-CD3 antibody. Note the enlarged, intensely staining paracortical areas of the node, 40x.

~~30~~ ~~2084~~ Figure 12. A) Structure and sequence of the protein coding region of human B7RP1 (hB7RP1). Predicted signal sequence of hB7RP1 is underlined at the amino-terminus. Predicted signal peptide cleavage sites are marked by asterisks. Predicted transmembrane sequence is underlined toward the carboxy-terminus. B) 35 Amino acid alignment of the putative mature hB7RP1 protein with the mature murine B7RP1 (mB7RP1) protein.

445  
Figure 13. A) Structure and sequence of the protein coding region of human CRP1 (hCRP1). Predicted signal sequence of hCRP1 is underlined at the amino-terminus. Predicted signal peptide cleavage sites are marked by asterisks. Predicted transmembrane sequence is underlined toward the carboxy-terminus. B) Amino acid alignment of the hCRP1 protein with the murine CRP1 (mB7RP1) protein.

Figure 14. CRP1 is on resting memory T-cells. Resting splenocytes from 6-7 month old mice were double-stained using B7RP1-Fc labeled by an FITC-conjugated anti-human Fc antibody and a PE-conjugated antibody to either CD44(Fig 14A), CD45RB(Fig 14B), or CD69(Fig 14C).

Figure 15. T-cell co-stimulation by B7RP1-Fc fusion protein. A) T-cell proliferation induced by different quantities of B7RP1-Fc (closed squares), B7.2-Fc (closed circles), or OPG-Fc fusion protein control (open squares) in conjunction with anti-CD3 antibody. Fusion proteins were used at various concentrations to coat 96 well plates pre-coated with anti-human Fc FAb<sub>2</sub> (12.5 µg/ml) and anti-CD3 antibody (0.9 µg/ml). B7RP1-Fc and B7.2-Fc co-stimulate T-cells in a dose-dependent fashion up to 0.3 µg/ml, at which the maximal effect is achieved. B) T-cell proliferation induced by B7RP1-Fc (closed squares), B7.2-Fc (closed circles), non-fused Fc (open squares), or no Fc (open circles) in conjunction an anti-CD3 antibody (0.85 µg/ml) and in the presence of various concentrations of a rabbit anti-B7RP1-Fc polyclonal antibody. Fc fusion proteins were used at a concentration of 0.3 µg/ml and were bound to the plates as above. The anti-B7RP1-Fc antibody was raised to

purified B7RP1-Fc by subcutaneous injections of antigen emulsified in adjuvant, and then was affinity purified. The antibodies were incubated for 30 min with the Fc fusion proteins before the addition of the cells. The  
5 anti-B7RP1-Fc antibody specifically inhibits the T-cell proliferation induced by B7RP1-Fc in a dose-dependent fashion.

Figure 16. Effect of CRP1-Fc and B7RP1-Fc  
10 proteins on the incidence (A) and severity (B) of collagen induced arthritis in mice. Collagen induced arthritis susceptible B10.RIII mice were immunized at the base of the tail with 10 µg porcine collagen type II in CFA. Mice received 100 µg of fusion protein twice  
15 per week. Fc fusion proteins and control PBS treatment are indicated in the figure legend.

10 Normal ileum from control Mouse#53F (female) showing the normal length of the villi and crypts in the ileal mucosa. H&E, 40x magnification. (F) Mild atrophy of ileal mucosa from B7RP1-Fc transgenic Mouse#231M (male) with focal loss and blunting of villi. H&E, 40x.

15

Figure 20. The B7RP1-Fc fusion protein inhibits tumor growth in mice. Meth A sarcoma cells were implanted intradermally in the abdomen of Balb/C mice. On days 7, 10, 14, and 17, after implantation, the mice were treated with vehicle (dark diamonds) or murine B7RP1-Fc (gray triangles, Example 7). Tumor volume was measured, as described in Example 20, on the indicated days after implantation. The tumor growth was monitored up to day 28. Each group had eight mice.

25

Figure 21. T-cell co-stimulation by human B7RP1-Fc. Anti-CD3 and human B7RP1 Fc were used to coat 96 well plates, and  $1 \times 10^5$  T-cells/well (>98% CD3+) were cultured and harvested as described in Example 21. A) Co-stimulation induced by anti-CD3 only (closed circles), 0.5  $\mu$ g/ml B7RP1 Fc (closed triangles), 0.5  $\mu$ g/ml OPG-Fc (open circles), and 5  $\mu$ g/ml anti-CD28 (open triangles) at different concentrations of anti-CD3 primary stimulation. Data show that B7RP1-Fc co-stimulated anti-CD3 primed T-

35

cells to similar levels as co-stimulation using anti-CD28 antibodies. Data shown are mean [<sup>3</sup>H]TdR incorporated +/- SD in triplicate wells from one representative experiment of several experiments generated with T-cells isolated from three normal donors. B) Dose-dependent inhibition of B7RP1-Fc co-stimulation by CRP1-Fc. T-cells were cultured in wells coated with both anti-CD3 at 0.3 µg/ml and 0.5 µg/ml B7RP1-Fc. Serially diluted concentrations of CRP1-Fc (closed circles) or OPG-Fc (open circles) were preincubated with the B7RP1-Fc for 30 min prior to the addition of T-cells. Data show that CRP1-Fc inhibits B7RP1 induced co-stimulation in a dose-dependent manner. Percent inhibition is plotted against CRP1-Fc or OPG-Fc protein concentration. Data shown are mean [<sup>3</sup>H]TdR incorporated +/- SD of three experiments done in triplicate wells and are representative of experiments generated with two normal donors. C) Co-stimulation by CHO human B7RP1 cells. T-cells were purified from peripheral blood and were cultured with various concentrations of anti-CD3 in the presence of anti-CD3 alone (closed circles), 1 x 10<sup>4</sup> CHO vector control cells (open circles) or 1 x 10<sup>4</sup> CHO B7RP1 cells (closed triangles), as described in Example 22. The data show that membrane-bound B7RP1 co-stimulated T-cell growth to a level similar to that observed using B7RP1-Fc fusion proteins. Data shown are the mean +/- SD of triplicate cultures and are representative of results generated with two normal donors. D) Cytokine production. T-cells were cultured as described in (Figure 21A) and supernatants were collected at 48 (black bars) and 72 (gray bar) hrs. Data show that the amount of IL-2 produced by B7RP1-Fc co-stimulated cells (top graph) was similar to that produced by cells stimulated by anti-CD3 and control Fc,

but significantly less than that produced by anti-CD28 co-stimulated cells. Data also show that B7RP1-Fc co-stimulation enhanced IL-10 (middle graph) and IFN-gamma (bottom graph) production.

5

Figure 22 shows IgE levels in control and B7RP1 transgenic mice.

Figure 23 shows the combined effects of B7RP1-Fc and B7.2-Fc on chronic hypersensitivity. Mice were challenged with oxazolone as described in Example 24. B7RP1-Fc, B7.2-Fc, B7RP1-Fc+B7.2-Fc, and Fc were given at high (2 or 1+1 mg/Kg, A) and low (0.4 or 0.2+0.2 mg/Kg, B) dose around the time of challenge. A, Compared to Fc, B7RP1-Fc B7.2-Fc, and B7RP1-Fc+B7.2-Fc increased  $\Delta$ ET from day 3 ( $p < 0.001$ ). B7RP1-Fc and B7RP1-Fc+B7.2-Fc increased  $\Delta$ ET more than B7.2-Fc from day 4 ( $p < 0.001$ ). B7RP1-Fc+B7.2-Fc increased  $\Delta$ ET more than B7RP1-Fc from day 4 ( $p < 0.001$ ). B, Compared to Fc, B7RP1-Fc and B7RP1-Fc+B7.2-Fc increased  $\Delta$ ET from day 4 ( $p < 0.001$ ). B7RP1-Fc and B7RP1-Fc+B7.2-Fc increased  $\Delta$ ET more than B7.2-Fc ( $p < 0.001$ ).

#### Detailed Description of the Invention

25 The invention provides for novel polypeptides referred to herein as CRP1 and B7RP1, which comprise a receptor-ligand pair that is involved in T-cell activation. cDNAs encoding the polypeptides were identified from a library prepared from mouse  
30 intestinal intraepithelial cells and screened on the basis of homology to the CD28 and CTLA-4 polypeptides (for CRP1) or B7.1 and B7.2 polypeptides (for B7RP1).  
~~CD28~~ CD28 related protein-1, or CRP1, is predicted to be a type I transmembrane protein with a signal

sequence and extracellular domain at the amino-terminus, a transmembrane domain, and a carboxy terminal intracellular domain (Figure 1). The full-length CRP1 protein is 180 amino acids in its mature form. The predicted leader sequence spans about amino acid residues 1-20 (relative to the initiating methionine) and the extracellular domain of the mature protein encompasses about residues 21-145 (Example 1). The predicted transmembrane domain spans about residues 146-163 and the intracellular domain encompasses about residues 164-200. The amino terminal extracellular domain is similar to an Ig loop with conserved putative intra- and inter-molecular bonding cysteines. Furthermore, a "MYPPPY" motif, which is previously known to be important for B7.1 and B7.2 binding to CD28 and CTLA-4, is also partially conserved.

CD28 and CTLA-4 are weakly homologous as exemplified by the 26% amino acid identity between murine CD28 and CTLA-4. There is 19% amino acid identity of CRP1 with murine CD28 and 14% identity of CRP1 with murine CTLA-4. However, critical cysteine residues are conserved between murine CD28, CTLA-4 and CRP1 at residues 42, 63, 83, 109, and 137 (relative to the initiating methionine in the CRP1 protein, See Figure 1A). The approximate mature protein lengths and locations of the transmembrane region relative to the carboxy terminus are also similar in CRP1, CD28, and CTLA-4.

Human CRP1 is a transmembrane protein having the nucleotide and amino acid sequence as shown in Figure 13A. The predicted leader sequence spans about residues 1-19 or about residues 1-20. The predicted mature amino terminus is at residues 20 or 21. Preferably, the mature amino terminus is at position 21. The extracellular domain spans from any of the predicted mature amino termini to about amino acid

35

[illegible]

CRP1 and B7RP1 bind each other, but CRP1 does not detectably bind to the B7RP1 related protein B7.2; and B7RP1 does not exhibit detectable binding to CRP1-related CD28 or CTLA-4 (Example 8). B7RP1 was shown to regulate T-cell proliferation, presumably through the interaction of B7RP1 with CRP1 receptors (Example 11). Thus, CRP1 and B7RP1 represent a novel pathway for regulating T-cell proliferation and activation.

The interaction of B7RP1 with CRP1 can be regulated in such a manner that immune costimulation and T-cell proliferation and activation can be increased or decreased. By way of example, anti-B7RP1 monoclonal and polyclonal antibodies raised against murine B7RP1 blocked the B7RP1/CRP1 interaction and also blocked T-cell proliferation induced by a B7RP1-Fc fusion protein (see Example 17). A human CRP1-Fc fusion protein blocked human T-cell proliferation induced by human B7RP1-Fc (Example 21). In addition, addition of a CRP1-Fc fusion protein delayed the onset of arthritic symptoms in a mouse model of rheumatoid arthritis (see Example 18). B7RP1/CRP1 co-stimulation can also be increased by addition of B7RP1-Fc fusion protein or other activators of this pathway (Example 20).

The term "isolated nucleic acid molecule" refers to a nucleic acid molecule that is free from at least one contaminating nucleic acid molecule with which it is naturally associated, and preferably substantially free from any other contaminating mammalian nucleic acid molecules.

The term "splice variant" refers to a nucleic acid molecule, usually RNA, which is generated by alternative processing of intron sequences in an RNA transcript.

The term "moderate stringency conditions" refers to those conditions which include the use of a

washing solution and hybridization conditions (e.g., temperature and ionic strength) less stringent than described above. An example of moderately stringent conditions are conditions such as overnight incubation at 37°C in a solution comprising: 20% formamide, 5 x SSC, 50 mM sodium phosphate (pH 7.6), 5 x Denhardt's solution, 10% dextran sulfate, and 20 µl/ml denatured sheared salmon sperm DNA, followed by washing the filters in 1 x SSC at about 37-50°C. The skilled artisan will recognize how to adjust the temperature, ionic strength and other parameters as necessary to accommodate factors such as probe length and the like.

Recombinant DNA technology methods are set forth in Sambrook *et al.* (*Molecular Cloning: A Laboratory Manual*, Cold Spring Harbor Laboratory Press, Cold Spring Harbor, NY (1989)) and/or Ausubel *et al.*, eds., (*Current Protocols in Molecular Biology*, Green Publishers Inc. and Wiley and Sons, NY (1994)) which are hereby incorporated by reference in their entirety.

The invention provides for isolated nucleic acid molecules encoding CRP1 and B7RP1 polypeptides. Also provided for are nucleic acid molecules which are fragments, allelic variants, splice variants, or are complementary in sequence to molecules encoding CRP1 and B7RP1 polypeptides. Nucleic acid molecules which are at least about 70% identical to molecules encoding CRP1 or B7RP1 or which hybridize to molecules encoding CRP1 or B7RP1 under moderate or high stringency conditions are also encompassed. The nucleic acid molecules may be cDNA, genomic DNA, RNA or a partially or totally synthetic nucleic acid molecule. In preferred embodiments, nucleic acid molecules of the invention are at least about 75%, 80%, 85%, 90% or 95%

identical to nucleic acid molecules encoding CRP1 or B7RP1.

A gene or cDNA encoding a CRP1 or B7RP1 polypeptide or fragment thereof may be obtained, for example, by hybridization screening or PCR amplification of a genomic or cDNA library. Probes or primers useful for screening the library can be generated based on sequence information for other known genes or gene fragments from the same or a related family of genes, for example, conserved motifs found in CRP1 or B7RP1 related polypeptides such as a conserved array of cysteine residues. In addition, where a gene encoding a CRP1 or B7RP1 polypeptide has been identified from one species, all or a portion of that gene may be used as a probe to identify homologous genes from other species. The probes or primers may be used to screen cDNA libraries from various tissue sources believed to express the CRP1 or B7RP1 gene.

Where oligonucleotide probes are used to screen cDNA or genomic libraries, one of the following two high stringency solutions may be used. The first of these is 6 X SSC with 0.05% sodium pyrophosphate at 35°C-62°C, with the temperature depending on the length of the oligonucleotide probe. For example, 14 base pair probes are washed at 35-40°C, 17 base pair probes are washed at 45-50°C, 20 base pair probes are washed at 52-57°C, and 23 base pair probes are washed at 57-63°C. The temperature can be increased 2-3°C where the background non-specific binding appears high. A second high stringency solution utilizes tetramethylammonium chloride (TMAC) for washing oligonucleotide probes. One stringent washing solution is 3 M TMAC, 50 mM Tris-HCl, pH 8.0, and 0.2% SDS. The washing temperature using this solution is a function of the length of the probe. For example, a 17 base pair probe is washed at about 45-50°C.

10

35

host cell. Affinity purification can be accomplished, for example, by column chromatography using antibodies against the tag as an affinity matrix. Optionally, the tag can subsequently be removed from a purified CRP1 or B7RP1 polypeptide by various means such as using certain peptidases.

The human immunoglobulin hinge and Fc region may be fused at either the N-terminus or C-terminus of a CRP1 or B7RP1 polypeptide by one skilled in the art. The subsequent Fc-fusion protein can be purified by use of a Protein A affinity column. An immunoglobulin Fc region is known to exhibit a long pharmacokinetic half-life *in vivo* and proteins fused to an Fc region have been found to exhibit a substantially greater half-life *in vivo* compared to the unfused counterpart. Also, fusion to the Fc region allows for dimerization and/or multimerization of the molecule that may be useful for the bioactivity of some molecules.

The flanking sequence may be homologous (*i.e.*, from the same species and/or strain as the host cell), heterologous (*i.e.*, from a species other than the host cell species or strain), hybrid (*i.e.*, a combination of flanking sequences from more than one source), synthetic, or it may be the native CRP1 or B7RP1 nucleic acid flanking sequences. As such, the source of the flanking sequence may be any unicellular prokaryotic or eukaryotic organism, any vertebrate or invertebrate organism, or any plant, provided that the flanking sequence is functional in, and can be activated by, the host cell machinery.

The flanking sequences useful in the vectors of this invention may be obtained by any of several methods well known in the art. Typically, flanking sequences useful herein other than CRP1 or B7RP1 nucleic acid flanking sequence will have been previously identified by mapping and/or by restriction

5

10

15

25

35

polypeptide coding sequence and serves to terminate transcription of a CRP1 or B7RP1 polypeptide. Usually, the transcription termination element in prokaryotic cells is a G-C rich fragment followed by a poly T  
5 sequence. While the element is easily cloned from a library or even purchased commercially as part of a vector, it can also be readily synthesized using methods for nucleic acid synthesis such as those described above.

10 A selectable marker gene element encodes a protein necessary for the survival and growth of a host cell grown in a selective culture medium. Typical selection marker genes encode proteins that (a) confer resistance to antibiotics or other toxins, e.g.,  
15 ampicillin, tetracycline, or kanamycin for prokaryotic host cells, (b) complement auxotrophic deficiencies of the cell; or (c) supply critical nutrients not available from complex media. Preferred selectable markers are the kanamycin resistance gene, the  
20 ampicillin resistance gene, and the tetracycline resistance gene.

The ribosome binding element, commonly called the Shine-Dalgarno sequence (prokaryotes) or the Kozak sequence (eukaryotes), is usually necessary for  
25 translational initiation of mRNA. The element is typically located 3' to the promoter and 5' to the coding sequence of the CRP1 or B7RP1 polypeptide to be synthesized. The Shine-Dalgarno sequence is varied but is typically a polypurine (i.e., having a high A-G  
30 content). Many Shine-Dalgarno sequences have been identified, each of which can be readily synthesized using methods set forth above and used in a prokaryotic vector.

In those cases where it is desirable for a  
35 CRP1 or B7RP1 polypeptide to be secreted from the host cell, a signal sequence may be used to direct export of

09728420 113800

the polypeptide from the host cell. A CRP1 or B7RP1 transmembrane domain is also inactivated by mutation or deletion to prevent attachment to the host membrane. Typically, the signal sequence is positioned in the coding region of a CRP1 or B7RP1 gene or cDNA, or directly at the 5' end of a CRP1 or B7RP1 gene coding region. Many signal sequences have been identified, and any of them that are functional in the selected host cell may be used in conjunction with a CRP1 or B7RP1 gene or cDNA. Therefore, the signal sequence may be homologous or heterologous to a CRP1 or B7RP1 gene or cDNA, and may be homologous or heterologous to a CRP1 or B7RP1 polypeptides gene or cDNA. Additionally, the signal sequence may be chemically synthesized using methods set forth above.

In most cases, secretion of the polypeptide from the host cell via the presence of a signal peptide will result in the removal of the amino terminal methionine from the polypeptide.

In many cases, transcription of a CRP1 or B7RP1 gene or cDNA is increased by the presence of one or more introns in the vector; this is particularly true where a CRP1 or B7RP1 polypeptide is produced in eukaryotic host cells, especially mammalian host cells. The introns used may be naturally occurring within a CRP1 or B7RP1 gene, especially where the gene used is a full length genomic sequence or a fragment thereof. Where the intron is not naturally occurring within the gene (as for most cDNAs), the intron(s) may be obtained from another source. The position of the intron with respect to the 5' flanking sequence and a CRP1 or B7RP1 gene is generally important, as the intron must be transcribed to be effective. As such, where a CRP1 or B7RP1 gene inserted into the expression vector is a cDNA molecule, the preferred position for the intron is 3' to the transcription start site, and 5' to the polyA

5 from any source, including any viral, prokaryotic and  
eukaryotic (plant or animal) organisms, may be used to  
practice this invention, provided that it is compatible  
with the host cell(s) into which it is inserted. Also  
included herein are synthetic introns. Optionally,  
10 more than one intron may be used in the vector.

15 elements are well known to the skilled artisan.

25 NY).

30 vector may be inserted into a suitable host cell for  
amplification and/or polypeptide expression.

35 host cell, when cultured under appropriate conditions,  
can synthesize a CRP1 or B7RP1 polypeptide which can

subsequently be collected from the culture medium (if the host cell secretes it into the medium) or directly from the host cell producing it (if it is not secreted). After collection, a CRP1 or B7RP1 polypeptide can be purified using methods such as molecular sieve chromatography, affinity chromatography, and the like.

Selection of the appropriate host cell for CRP1 or B7RP1 polypeptide production will depend on various factors, such as desired expression levels, polypeptide modifications that are required for activity, such as glycosylation or phosphorylation, or ease of folding into a biologically active molecule.

Suitable cells or cell lines may be mammalian cells, such as Chinese hamster ovary cells (CHO), human embryonic kidney (HEK) 293 or 293T-cells, or 3T3 cells. The selection of suitable mammalian host cells and methods for transformation, culture, amplification, screening and product production and purification are known in the art. Other suitable mammalian cell lines, are the monkey COS-1 and COS-7 cell lines, and the CV-1 cell line. Further exemplary mammalian host cells include primate cell lines and rodent cell lines, including transformed cell lines. Normal diploid cells, cell strains derived from *in vitro* culture of primary tissue, as well as primary explants, are also suitable. Candidate cells may be genotypically deficient in the selection gene, or may contain a dominantly acting selection gene. Other suitable mammalian cell lines include but are not limited to, mouse neuroblastoma N2A cells, HeLa, mouse L-929 cells, 3T3 lines derived from Swiss, Balb-c or NIH mice, BHK or HaK hamster cell lines.

Similarly useful as host cells are bacterial cells. For example, the various strains of *E. coli*

(e.g., HB101, DH5 $\alpha$ , DH10, and MC1061) are well-known as host cells in the field of biotechnology. Various strains of *B. subtilis*, *Pseudomonas spp.*, other *Bacillus spp.*, *Streptomyces spp.*, and the like may also  
5 be employed in this method.

Many strains of yeast cells known to those skilled in the art are also available as host cells for expression of the polypeptides of the present invention.

10 Additionally, where desired, insect cell systems may be utilized in the methods of the present invention. Such systems are described for example in Kitts et al. (*Biotechniques*, 14:810-817 (1993)), Lucklow (*Curr. Opin. Biotechnol.*, 4:564-572 (1993)) and  
15 Lucklow et al. (*J. Virol.*, 67:4566-4579 (1993)). Preferred insect cells are Sf-9 and Hi5 (Invitrogen, Carlsbad, CA).

"Transformation" or "transfection" of an expression vector into the selected host cell may be  
20 accomplished using such methods as calcium chloride, electroporation, microinjection, lipofection or the DEAE-dextran method. The method selected will in part be a function of the type of host cell to be used. These methods and other suitable methods are well known  
25 to the skilled artisan, and are set forth, for example, in Sambrook et al., *supra*.

The host cells transformed or transfected with an expression vector may be cultured using standard media well known to the skilled artisan. The  
30 media will usually contain all nutrients necessary for the growth and survival of the cells. Suitable media for culturing *E. coli* cells are, for example, Luria Broth (LB) and/or Terrific Broth (TB). Suitable media for culturing eukaryotic cells are RPMI 1640, MEM,  
35 DMEM, all of which may be supplemented with serum

Typically, an antibiotic or other compound useful for selective growth of the transformed cells only is added as a supplement to the media. The compound to be used will be dictated by the selectable marker element present on the plasmid with which the host cell was transformed. For example, where the selectable marker element is kanamycin resistance, the compound added to the culture medium will be kanamycin.

If a CRP1 or B7RP1 polypeptide has been designed to be secreted from the host cells, the majority of polypeptide may be found in the cell culture medium. Polypeptides prepared in this way will typically not possess an amino terminal methionine, as it is removed during secretion from the cell. If, however, a CRP1 or B7RP1 polypeptide is not secreted from the host cells, it will be present in the cytoplasm and/or the nucleus (for eukaryotic host cells) or in the cytosol (for gram negative bacteria host cells) and may have an amino terminal methionine.

Purification of a CRP1 or B7RP1 polypeptide from solution can be accomplished using a variety of techniques. If the polypeptide has been synthesized such that it contains a tag such as Hexahistidine (CRP1

or B7RP1/hexaHis) or other small peptide such as FLAG (Eastman Kodak Co., New Haven, CT) or *myc* (Invitrogen, Carlsbad, CA) at either its carboxyl or amino terminus, it may essentially be purified in a one-step process by  
5 passing the tagged polypeptide through an affinity column where the column matrix has a high affinity for the tag or for the polypeptide directly (*i.e.*, a monoclonal antibody specifically recognizing a CRP1 or B7RP1 polypeptide). For example, polyhistidine binds  
10 with great affinity and specificity to nickel, thus an affinity column of nickel (such as the Qiagen® nickel columns) can be used for purification of CRP1 or B7RP1/polyHis. (See for example, Ausubel et al., eds., *Current Protocols in Molecular Biology*, Section  
15 10.11.8, John Wiley & Sons, New York (1993)).

Where a CRP1 or B7RP1 polypeptide is prepared without a tag attached, and no antibodies are available, other well known procedures for purification can be used. Such procedures include, without  
20 limitation, ion exchange chromatography, molecular sieve chromatography, HPLC, native gel electrophoresis in combination with gel elution, and preparative isoelectric focusing ("Isoprime" machine/technique, Hoefer Scientific). In some cases, two or more of  
25 these techniques may be combined to achieve increased purity.

If it is anticipated that a CRP1 or B7RP1 polypeptide will be found primarily intracellularly, the intracellular material (including inclusion  
30 bodies for gram-negative bacteria) can be extracted from the host cell using any standard technique known to the skilled artisan. For example, the host cells can be lysed to release the contents of the periplasm/cytoplasm by French press, homogenization,  
35 and/or sonication followed by centrifugation.

09728420 112300

If a CRP1 or B7RP1 polypeptide has formed inclusion bodies in the cytosol, the inclusion bodies can often bind to the inner and/or outer cellular membranes and thus will be found primarily in the pellet material after centrifugation. The pellet material can then be treated at pH extremes or with chaotropic agent such as a detergent, guanidine, guanidine derivatives, urea, or urea derivatives in the presence of a reducing agent such as dithiothreitol at alkaline pH or tris carboxyethyl phosphine at acid pH to release, break apart, and solubilize the inclusion bodies. The polypeptide in its now soluble form can then be analyzed using gel electrophoresis, immunoprecipitation or the like. If it is desired to isolate a CRP1 or B7RP1 polypeptide, isolation may be accomplished using standard methods such as those set forth below and in Marston *et al.* (*Meth. Enz.*, 182:264-275 (1990)). In some cases, a CRP1 or B7RP1 polypeptide may not be biologically active upon isolation. Various methods for "refolding" or converting the polypeptide to its tertiary structure and generating disulfide linkages can be used to restore biological activity. Such methods include contacting the solubilized polypeptide with a solution having a pH usually above 7 and in the presence of a particular concentration of an appropriate chaotrope. In most cases the refolding/oxidation solution will also contain a reducing agent or the reducing agent and the corresponding oxidized form in a specific ratio to generate a particular redox potential allowing for disulfide shuffling to occur in the formation of the protein's cysteine bridge(s). Some of the commonly used redox couples include cysteine/cystamine, glutathione (GSH)/dithiobis GSH, cupric chloride,

dithiothreitol (DTT)/dithiane DTT, 2-mercaptoethanol (BME)/dithio-B (ME). In many instances a cosolvent is necessary to increase the efficiency of the refolding and the more common  
5 reagents used for this purpose include glycerol, polyethylene glycol of various molecular weights, and arginine.

CRP1 or B7RP1 polypeptides, fragments, and/or derivatives thereof may also be prepared by  
10 chemical synthesis methods (such as solid phase peptide synthesis) using techniques known in the art such as those set forth by Merrifield et al., (*J. Am. Chem. Soc.*, 85:2149 (1963)), Houghten et al. (*Proc Natl Acad. Sci. USA*, 82:5132 (1985)), and  
15 Stewart and Young (*Solid Phase Peptide Synthesis*, Pierce Chemical Co., Rockford, IL (1984)). Such polypeptides may be synthesized with or without a methionine on the amino terminus. Chemically  
20 synthesized CRP1 or B7RP1 polypeptides or fragments may be oxidized using methods set forth in these references to form disulfide bridges. CRP1 or B7RP1 polypeptides or fragments are expected to have biological activity comparable to CRP1 or B7RP1  
25 polypeptides produced recombinantly or purified from natural sources, and thus may be used interchangeably with recombinant or natural CRP1 or B7RP1 polypeptide.

#### Polypeptides

30 ~~The term "CRP1 or B7RP1 polypeptide" refers to a polypeptide having the amino acid sequence of Figure 1A (SEQ ID NO:2), Figure 2A (SEQ ID NO:7) or Figure 3A (SEQ ID NO:12) and all related polypeptides described herein. Related polypeptides includes~~  
35 ~~allelic variants, splice variants, fragments, derivatives, substitution, deletion, and insertion~~

C4  
cond

variants, fusion polypeptides, and orthologs. Such related polypeptides may be mature polypeptides, i.e., polypeptide lacking a signal peptide. A CRP1 or B7RP1 polypeptide may or may not have amino terminal methionine, depending on the manner in which they are prepared.

The term "CRP1 or B7RP1 polypeptide fragment" refers to a peptide or polypeptide that is less than the full length amino acid sequence of a CRP1 or B7RP1 polypeptide as set forth in Figure 1A (SEQ ID NO:2), Figure 2A (SEQ ID NO:7) or Figure 3A (SEQ ID NO:12). Such a fragment may result from truncation at the amino terminus, truncation at the carboxy terminus, and/or a deletion internal to the polypeptide sequence. Such CRP1 or B7RP1 polypeptides fragments may be prepared with or without an amino terminal methionine. In addition, CRP1 or B7RP1 polypeptides fragments may be naturally-occurring splice variants, other splice variants, and fragments resulting from naturally occurring *in vivo* protease activity. Preferred CRP1 or B7RP1 polypeptide fragments include soluble forms of CRP1 or B7RP1 which lack a functional transmembrane domain and comprise part or all of the extracellular domain of either CRP1 or B7RP1.

The term "CRP1 or B7RP1 polypeptide variants" refers to CRP1 or B7RP1 polypeptides whose amino acid sequences contain one or more amino acid sequence substitutions, deletions, and/or additions as compared to the CRP1 or B7RP1 polypeptides amino acid sequences set forth in Figure 1A (SEQ ID NO:2), Figure 2A (SEQ ID NO:7) or Figure 3A (SEQ ID NO:12). Such CRP1 or B7RP1 polypeptides variants can be prepared from the corresponding CRP1 and B7RP1 polypeptides nucleic acid molecule variants, which have a DNA sequence that varies accordingly from the DNA sequences for CRP1 or B7RP1 polypeptides.

09728420 112800

15

25

The term "mature amino acid sequence" refers to a polypeptide lacking a leader sequence.

30

35

5

10

35

Preferred methods to determine identity and/or similarity are designed to give the largest match between the sequences tested. Methods to determine identity and similarity are codified in publicly available computer programs. Preferred computer program methods to determine identity and similarity between two sequences include, but are not limited to, the GCG program package, including GAP (Devereux, J., et al., *Nucleic Acids Research* 12(1):387 (1984); Genetics Computer Group, University of Wisconsin, Madison, WI), BLASTP, BLASTN, and FASTA (Atschul, S.F. et al., *J. Molec. Biol.* 215:403-410 (1990). The BLAST X program is publicly available from the National Center for Biotechnology Information (NCBI) and other sources (*BLAST Manual*, Altschul, S., et al. NCB NLM NIH Bethesda, MD 20894; Altschul, S., et al., *J. Mol. Biol.* 215:403-410 (1990). The well known Smith Waterman algorithm may also be used to determine identity.

By way of example, using the computer algorithm GAP (Genetics Computer Group, University of Wisconsin, Madison, WI), two polypeptides for which the percent sequence identity is to be determined are aligned for optimal matching of their respective amino acids (the "matched span", as determined by the algorithm). A gap opening penalty (which is calculated

as 3 X the average diagonal; the "average diagonal" is the average of the diagonal of the comparison matrix being used; the "diagonal" is the score or number assigned to each perfect amino acid match by the particular comparison matrix) and a gap extension penalty (which is usually 1/10 times the gap opening penalty), as well as a comparison matrix such as PAM 250 or BLOSUM 62 are used in conjunction with the algorithm. A standard comparison matrix (see Dayhoff et al., in: Atlas of Protein Sequence and Structure, vol. 5, supp.3 (1978) for the PAM250 comparison matrix; see Henikoff et al., *Proc. Natl. Acad. Sci USA*, 89:10915-10919 (1992) for the BLOSUM 62 comparison matrix) is also used by the algorithm.

Preferred parameters for polypeptide sequence comparison include the following:

Algorithm: Needleman and Wunsch, *J. Mol. Biol.* 48:443-453 (1970)

Comparison matrix: BLOSUM 62 from Henikoff and Henikoff, *Proc. Natl. Acad. Sci. USA* 89:10915-10919 (1992)

Gap Penalty: 12

Gap Length Penalty: 4

Threshold of Similarity: 0

The GAP program is useful with the above parameters. The aforementioned parameters are the default parameters for polypeptide comparisons (along with no penalty for end gaps) using the GAP algorithm.

Preferred parameters for nucleic acid molecule sequence comparison include the following:

Algorithm: Needleman and Wunsch, *J. Mol Biol.* 48:443-453 (1970)

Comparison matrix: matches = +10, mismatch = 0

Gap Penalty: 50

Gap Length Penalty: 3

5           The GAP program is also useful with the above parameters. The aforementioned parameters are the default parameters for nucleic acid molecule comparisons.

10           Other exemplary algorithms, gap opening penalties, gap extension penalties, comparison matrices, thresholds of similarity, etc. may be used by those of skill in the art, including those set forth in the Program Manual, Wisconsin Package, Version 9,  
15           September, 1997. The particular choices to be made will depend on the specific comparison to be made, such as DNA to DNA, protein to protein, protein to DNA; and additionally, whether the comparison is between pairs of sequences (in which case GAP or BestFit are  
20           generally preferred) or between one sequence and a large database of sequences (in which case FASTA or BLASTA are preferred).

          Polypeptides that are at least about 70 percent identical will typically have one or more amino  
25           acid substitutions, deletions, and/or additions as compared to a wild type CRP1 or B7RP1 polypeptide. In preferred embodiment, polypeptides will have about 75%, 80%, 85%, 90% or 95% identity to CRP1 or B7RP1  
30           polypeptides. Usually, the substitutions of the native residue will be either alanine, or a conservative amino acid so as to have little or no effect on the overall net charge, polarity, or hydrophobicity of the polypeptide. Conservative substitutions are set forth in Table I below.

5

CRP1 or B7RP1 polypeptide derivatives are provided by the invention. In one embodiment, chemically modified CRP1 or B7RP1 polypeptide compositions in which CRP1 or B7RP1 polypeptides are  
10 linked to a polymer are included within the scope of the present invention. The polymer selected is typically water soluble so that the protein to which it is attached does not precipitate in an aqueous environment, such as a physiological environment.  
15 The polymer selected is usually modified to have a

single reactive group, such as an active ester for acylation or an aldehyde for alkylation, so that the degree of polymerization may be controlled as provided for in the present methods. The polymer  
5 may be of any molecular weight, and may be branched or unbranched. Included within the scope of the invention is a mixture of polymers. Preferably, for therapeutic use of the end-product preparation, the polymer will be pharmaceutically acceptable.

10 The water soluble polymer or mixture thereof may be selected from the group consisting of, for example, polyethylene glycol (PEG), monomethoxy-polyethylene glycol, dextran, cellulose, or other carbohydrate based polymers, poly-(N-vinyl  
15 pyrrolidone) polyethylene glycol, propylene glycol homopolymers, a polypropylene oxide/ethylene oxide co-polymer, polyoxyethylated polyols (e.g., glycerol) and polyvinyl alcohol.

For the acylation reactions, the polymer(s)  
20 selected should have a single reactive ester group. For reductive alkylation, the polymer(s) selected should have a single reactive aldehyde group. A preferred reactive aldehyde is polyethylene glycol propionaldehyde, which is water stable, or mono C1-C10  
25 alkoxy or aryloxy derivatives thereof (see U.S. Patent No. 5,252,714).

Pegylation of CRP1 or B7RP1 polypeptides may be carried out by any of the pegylation reactions known in the art, as described for example in the following  
30 references: *Focus on Growth Factors* 3: 4-10 (1992); EP 0 154 316; and EP 0 401 384. Preferably, the pegylation is carried out via an acylation reaction or an alkylation reaction with a reactive polyethylene glycol molecule (or an analogous reactive water-soluble  
35 polymer) as described below.

5 A particularly preferred water-soluble polymer for use herein is polyethylene glycol, abbreviated PEG. As used herein, polyethylene glycol is meant to encompass any of the forms of PEG that have been used to derivatize other proteins, such as mono- (C1-C10) alkoxy- or aryloxy-polyethylene glycol.

10 In general, chemical derivatization may be performed under any suitable conditions used to react a biologically active substance with an activated polymer molecule. Methods for preparing pegylated CRP1 and B7RP1 polypeptides will generally comprise the steps of (a) reacting the polypeptide with polyethylene glycol (such as a reactive ester or aldehyde derivative of PEG) under conditions whereby CRP1 or B7RP1 polypeptide becomes attached to one or more PEG groups, and (b) obtaining the reaction product(s). In general, the optimal reaction conditions for the acylation reactions will be determined based on known parameters and the desired result. For example, the larger the ratio of PEG: protein, the greater the percentage of poly-pegylated product.

15 Generally, conditions which may be alleviated or modulated by administration of CRP1 or B7RP1 polymer conjugates include those described herein for non-conjugated CRP1 or B7RP1 polypeptides. However, the conjugated disclosed herein may have additional activities, enhanced or reduced biological activity, or other characteristics, such as increased or decreased half-life, as compared to the non-derivatized molecules.

30 CRP1 or B7RP1 polypeptides, fragments variants, and derivatives, may be employed alone, together, or in combination with other pharmaceutical compositions. CRP1 or B7RP1 polypeptides, fragments, variants, and derivatives may be used in combination with cytokines, growth factors, antibiotics, anti-

09723420-113300  
SECRET

inflammatories, and/or chemotherapeutic agents as is appropriate for the indication being treated.

The invention provides for selective binding agents of CRP1 or B7RP1. A selective binding agent refers to a molecule having specificity for CRP1 or B7RP1 and may include a protein, peptide, nucleic acid, carbohydrate, lipid or small molecular weight compound. A selective binding agent interacts either with CRP1 or B7RP1 and in turn regulates the binding of CRP1 to B7RP1. In one embodiment, a selective binding agent partially or completely blocks the binding of CRP1 to B7RP1 and partially or completely inhibits at least one biological activity of CRP1 or B7RP1, such as immune costimulatory activity. In another embodiment, the selective binding agent is an antibody. The antibody may be immunoreactive with either CRP1 or B7RP1 and is preferably immunoreactive with B7RP1. In yet another embodiment of the invention, an antibody reactive with B7RP1 binds to an epitope on B7RP1 such that binding to CRP1 is partially or completely blocked and at least one biological activity of B7RP1, such as immune costimulatory activity, is partially or completely inhibited. The term partially inhibited means that at least a detectable level of inhibition has occurred. The term completely inhibited means that no further increase in inhibition has occurred.

CRP1 or B7RP1 polypeptides, fragments, variants, and/or derivatives may be used to prepare antibodies using methods known in the art. Thus, antibodies that react with the CRP1 or B7RP1 polypeptides, as well as reactive fragments of such antibodies, are also contemplated as within the scope of the present invention. The antibodies may be polyclonal, monoclonal, recombinant, chimeric, single-chain and/or bispecific. Typically, the antibody or

fragment thereof will either be of human origin, or will be "humanized", i.e., prepared so as to prevent or minimize an immune reaction to the antibody when administered to a patient. The antibody fragment may  
5 be any fragment that is reactive with CRP1 and B7RP1 polypeptides of the present invention, such as, Fab, Fab', etc. Also provided by this invention are the hybridomas generated by presenting any CRP1 or B7RP1 polypeptide or fragments thereof as an antigen to a  
10 selected mammal, followed by fusing cells (e.g., spleen cells) of the mammal with certain cancer cells to create immortalized cell lines by known techniques. The methods employed to generate such cell lines and antibodies directed against all or portions of a human  
15 CRP1 or B7RP1 polypeptide of the present invention are also encompassed by this invention.

Monoclonal antibodies of the invention include "chimeric" antibodies in which a portion of the heavy and/or light chain is identical with or  
20 homologous to corresponding sequence in antibodies derived from a particular species or belonging to a particular antibody class or subclass, while the remainder of the chains(s) is identical with or homologous to corresponding sequence in antibodies  
25 derived from another species or belonging to another antibody class or subclass, as well as fragments of such antibodies, so long as they exhibit the desired biological activity (U.S. Patent No. 4,816,567; Morrison, et al., Proc. Natl. Acad. Sci. 81, 6851-6855  
30 (1985)).

In a preferred embodiment, the chimeric anti-CRP1 or B7RP1 antibody is a "humanized" antibody. Methods for humanizing non-human antibodies are well known in the art. Generally, a humanized antibody has  
35 one or more amino acid residues introduced into it from

09728420 11300  
a source which is non-human. Humanization can be performed following methods known in the art (Jones, et al., Nature 321, 522-525 (1986); Riechmann, et al., Nature, 332, 323-327 (1988); Verhoeyen, et al., Science 239, 1534-1536 (1988)), by substituting rodent complementarily-determining regions (CDRs) for the corresponding regions of a human antibody.

Also encompassed by the invention are fully human anti-CRP1 or anti-B7RP1 antibodies. Such antibodies may be produced by immunization with a CRP1 or B7RP1 antigen of transgenic animals (e.g., mice) that are capable of producing a repertoire of human antibodies in the absence of endogenous immunoglobulin production. See, for example, Jakobovits, et al., Proc. Natl. Acad. Sci. 90, 2551-2555 (1993); Jakobovits, et al., Nature 362, 255-258 (1993). Human antibodies can also be produced in phage-display libraries (Hoogenboom, et al., J. Mol. Biol. 227, 381 (1991); Marks, et al., J. Mol. Biol. 222, 581 (1991).

Selective binding agents of the invention may be used to regulate the binding of CRP1 to B7RP1 and regulate at least one biological activity mediated by CRP1 and B7RP1 such as immune co-stimulation. An example of such selective binding agents are antibodies immunoreactive with either CRP1 or B7RP1. The antibodies may be used therapeutically, such as to inhibit binding of the CRP1 and B7RP1 polypeptide to its binding partner. The antibodies may further be used for *in vivo* and *in vitro* diagnostic purposes, such as in labeled form to detect the presence of CRP1 and B7RP1 polypeptide in a body fluid or cell sample.

#### Pharmaceutical Compositions and Administration

Pharmaceutical compositions of CRP1 or B7RP1 polypeptides are within the scope of the present invention. Such compositions may comprise a

therapeutically effective amount of the polypeptide or fragments, variants, or derivatives in admixture with a pharmaceutically acceptable carrier. In preferred embodiments, pharmaceutical compositions comprise CRP1 or B7RP1 polypeptides as soluble forms which comprise part or all of a CRP1 or B7RP1 extracellular domain. Typically, a CRP1 and B7RP1 polypeptide therapeutic compound will be administered in the form of a composition comprising purified polypeptide, fragment, variant, or derivative in conjunction with one or more physiologically acceptable carriers, excipients, or diluents. The carrier material may be water for injection, preferably supplemented with other materials common in solutions for administration to mammals. Neutral buffered saline or saline mixed with serum albumin are exemplary appropriate carriers. Preferably, the product is formulated as a lyophilizate using appropriate excipients (e.g., sucrose). Other standard carriers, diluents, and excipients may be included as desired. Other exemplary compositions comprise Tris buffer of about pH 7.0-8.5, or acetate buffer of about pH 4.0-5.5, which may further include sorbitol or a suitable substitute therefor.

CRP1 or B7RP1 pharmaceutical compositions can be administered parenterally. Alternatively, the compositions may be administered intravenously or subcutaneously. When systemically administered, the therapeutic compositions for use in this invention may be in the form of a pyrogen-free, parenterally acceptable aqueous solution. The preparation of such pharmaceutically acceptable protein solutions, with due regard to pH, isotonicity, stability and the like, is within the skill of the art.

Therapeutic formulations of CRP1 and B7RP1 polypeptide compositions useful for practicing the present invention may be prepared for storage by mixing

09728420 112800

the selected composition having the desired degree of purity with optional physiologically acceptable carriers, excipients, or stabilizers (*Remington's Pharmaceutical Sciences*, 18th Edition, A.R. Gennaro, ed., Mack Publishing Company (1990)) in the form of a lyophilized cake or an aqueous solution. Acceptable carriers, excipients or stabilizers are nontoxic to recipients and are preferably inert at the dosages and concentrations employed, and include buffers such as phosphate, citrate, or other organic acids; antioxidants such as ascorbic acid; low molecular weight polypeptides; proteins, such as serum albumin, gelatin, or immunoglobulins; hydrophilic polymers such as polyvinylpyrrolidone; amino acids such as glycine, glutamine, asparagine, arginine or lysine; monosaccharides, disaccharides, and other carbohydrates including glucose, mannose, or dextrans; chelating agents such as EDTA; sugar alcohols such as mannitol or sorbitol; salt-forming counterions such as sodium; and/or nonionic surfactants such as Tween, pluronics or polyethylene glycol (PEG).

An effective amount of a CRP1 or B7RP1 polypeptide composition(s) to be employed therapeutically will depend, for example, upon the therapeutic objectives such as the indication for which the CRP1 and B7RP1 polypeptide is being used, the route of administration, and the condition of the patient. Accordingly, it will be necessary for the therapist to titer the dosage and modify the route of administration as required to obtain the optimal therapeutic effect. A typical daily dosage may range from about 0.1  $\mu\text{g/kg}$  to up to 100 mg/kg or more, depending on the factors mentioned above. Typically, a clinician will administer the composition until a dosage is reached that achieves the desired effect. The composition may therefore be administered as a single dose, or as two

or more doses (which may or may not contain the same amount of a CRP1 or B7RP1 polypeptide) over time, or as a continuous infusion via implantation device or catheter.

5           As further studies are conducted, information will emerge regarding appropriate dosage levels for treatment of various conditions in various patients, and the ordinary skilled worker, considering the therapeutic context, the type of disorder under  
10 treatment, the age and general health of the recipient, will be able to ascertain proper dosing.

          The CRP1 or B7RP1 polypeptide composition to be used for *in vivo* administration must be sterile. This is readily accomplished by filtration through  
15 sterile filtration membranes. Where the composition is lyophilized, sterilization using these methods may be conducted either prior to, or following, lyophilization and reconstitution. The composition for parenteral  
20 administration ordinarily will be stored in lyophilized form or in solution.

          Therapeutic compositions generally are placed into a container having a sterile access port, for example, an intravenous solution bag or vial having a stopper pierceable by a hypodermic injection needle.

25           The route of administration of the composition is in accord with known methods, e.g. oral, injection or infusion by intravenous, intraperitoneal, intracerebral (intraparenchymal),  
intracerebroventricular, intramuscular, intraocular,  
30 intraarterial, or intralesional routes, or by sustained release systems or implantation device which may optionally involve the use of a catheter. Where desired, the compositions may be administered  
continuously by infusion, bolus injection or by  
35 implantation device.

093400 " 44300

Alternatively or additionally, the composition may be administered locally via implantation into the affected area of a membrane, sponge, or other appropriate material on to which CRP1 and B7RP1 polypeptide has been absorbed.

Where an implantation device is used, the device may be implanted into any suitable tissue or organ, and delivery of a CRP1 or B7RP1 polypeptide may be directly through the device via bolus, or via continuous administration, or via catheter using continuous infusion. A CRP1 or B7RP1 polypeptide may be administered in a sustained release formulation or preparation. Suitable examples of sustained-release preparations include semipermeable polymer matrices in the form of shaped articles, e.g. films, or microcapsules. Sustained release matrices include polyesters, hydrogels, polylactides (U.S. 3,773,919, EP 58,481), copolymers of L-glutamic acid and gamma ethyl-L-glutamate (Sidman *et al*, *Biopolymers*, 22: 547-556 (1983)), poly (2-hydroxyethyl-methacrylate) (Langer *et al.*, *J. Biomed. Mater. Res.*, 15: 167-277 (1981)] and Langer, *Chem. Tech.*, 12: 98-105 (1982)), ethylene vinyl acetate (Langer *et al.*, *supra*) or poly-D(-)-3-hydroxybutyric acid (EP 133,988). Sustained-release compositions also may include liposomes, which can be prepared by any of several methods known in the art (e.g., Eppstein *et al.*, *Proc. Natl. Acad. Sci. USA*, 82: 3688-3692 (1985); EP 36,676; EP 88,046; EP 143,949).

In some cases, it may be desirable to use CRP1 or B7RP1 polypeptide compositions in an *ex vivo* manner. Here, cells, tissues, or organs that have been removed from the patient are exposed to a CRP1 or B7RP1 polypeptide compositions after which the cells, tissues and/or organs are subsequently implanted back into the patient.

0922420 11200

In other cases, a CRP1 or B7RP1 polypeptide may be delivered through implanting into patients certain cells that have been genetically engineered, using methods such as those described herein, to  
5 express and secrete the polypeptides, fragments, variants, or derivatives. Such cells may be animal or human cells, and may be derived from the patient's own tissue or from another source, either human or non-human. Optionally, the cells may be immortalized.  
10 However, in order to decrease the chance of an immunological response, it is preferred that the cells be encapsulated to avoid infiltration of surrounding tissues. The encapsulation materials are typically biocompatible, semi-permeable polymeric enclosures or  
15 membranes that allow release of the protein product(s) but prevent destruction of the cells by the patient's immune system or by other detrimental factors from the surrounding tissues.

Methods used for membrane encapsulation of  
20 cells are familiar to the skilled artisan, and preparation of encapsulated cells and their implantation in patients may be accomplished without undue experimentation. See, e.g., U.S Patent Nos. 4,892,538; 5,011,472; and 5,106,627. A system for  
25 encapsulating living cells is described in PCT WO 91/10425 (Aebischer et al.). Techniques for formulating a variety of other sustained or controlled delivery means, such as liposome carriers, bio-erodible particles or beads, are also known to those in the art,  
30 and are described, for example, in U.S. Patent No. 5,653,975. The cells, with or without encapsulation, may be implanted into suitable body tissues or organs of the patient.

As discussed above, it may be desirable to  
35 treat cell preparations with one or more CRP1 or B7RP1 polypeptides, variants, derivatives and/or fragments.

This can be accomplished by exposing, for example, cells comprising T-cells, such as bone marrow cells, to the polypeptide, variant, derivative, or fragment directly, where it is in a form that is permeable to the cell membrane. For example, cells comprising T-cells may be exposed to a B7RP1 polypeptide in order to activate T-cell function and the cells so treated are implanted in the patient.

Alternatively, gene therapy can be employed. One manner in which gene therapy can be applied is to use a CRP1 or B7RP1 gene (either genomic DNA, cDNA, and/or synthetic DNA encoding a CRP1 or B7RP1 polypeptide, or a fragment, variant, or derivative thereof) which may be operably linked to a constitutive or inducible promoter to form a "gene therapy DNA construct". The promoter may be homologous or heterologous to the endogenous CRP1 or B7RP1 gene, provided that it is active in the cell or tissue type into which the construct will be inserted. Other components of the gene therapy DNA construct may optionally include, as required, DNA molecules designed for site-specific integration (e.g., endogenous flanking sequences useful for homologous recombination), tissue-specific promoter, enhancer(s) or silencer(s), DNA molecules capable of providing a selective advantage over the parent cell, DNA molecules useful as labels to identify transformed cells, negative selection systems, cell specific binding agents (as, for example, for cell targeting) cell-specific internalization factors, and transcription factors to enhance expression by a vector as well as factors to enable vector manufacture.

This gene therapy DNA construct can then be introduced into the patient's cells (either *ex vivo* or *in vivo*). One means for introducing the gene therapy DNA construct is via viral vectors. Suitable viral

vectors typically used in gene therapy for delivery of gene therapy DNA constructs include, without limitation, adenovirus, adeno-associated virus, herpes simplex virus, lentivirus, papilloma virus, and  
5 retrovirus vectors. Some of these vectors, such as retroviral vectors, will deliver the gene therapy DNA construct to the chromosomal DNA of the patient's cells, and the gene therapy DNA construct can integrate into the chromosomal DNA; other vectors will function  
10 as episomes and the gene therapy DNA construct will remain in the cytoplasm. The use of gene therapy vectors is described, for example, in U.S. Patent Nos. 5,672,344, 5,399,346.

Alternative means to deliver gene therapy DNA  
15 constructs to a patient's cells without the use of viral vectors include, without limitation, liposome-mediated transfer, direct injection of naked DNA, receptor-mediated transfer (ligand-DNA complex), electroporation, calcium phosphate precipitation, and  
20 microparticle bombardment (e.g., "gene gun"). See U.S. Patent Nos. 4,970,154, WO 96/40958, 5,679,559, 5,676,954, and 5,593,875.

Another means to increase endogenous CRP1 or B7RP1 polypeptide expression in a cell via gene therapy  
25 is to insert one or more enhancer elements into the CRP1 or B7RP1 polypeptide promoter, where the enhancer element(s) can serve to increase transcriptional activity of a CRP1 or B7RP1 polypeptide gene. The enhancer element(s) used will be selected based on the  
30 tissue in which one desires to activate the gene(s); enhancer elements known to confer promoter activation in that tissue will be selected. For example, if a CRP1 or B7RP1 polypeptide is to be "turned on" in T-cells, the *lck* promoter enhancer element may be used.  
35 Here, the functional portion of the transcriptional element to be added may be inserted into a fragment of

09728420-12800

**09-06-2017**

[illegible]

**09-06-2017**

via a viral vector as described above. Typically, integration of the construct into the genomic DNA of the cells will be via homologous recombination, where the 5' and 3' flanking DNA sequences in the promoter  
5 construct can serve to help integrate the modified promoter region via hybridization to the endogenous chromosomal DNA.

Other gene therapy methods may also be employed where it is desirable to inhibit one or more  
10 CRP1 or B7RP1 polypeptides. For example, antisense DNA or RNA molecules, which have a sequence that is complementary to at least a portion of a selected CRP1 or B7RP1 polypeptide gene(s) can be introduced into the cell. Typically, each such antisense molecule will be  
15 complementary to the start site (5' end) of each selected CRP1 or B7RP1 gene. When the antisense molecule then hybridizes to the corresponding CRP1 or B7RP1 polypeptide mRNA, translation of this mRNA is prevented.

20 Alternatively, gene therapy may be employed to create a dominant-negative inhibitor of one or more CRP1 or B7RP1 polypeptides. In this situation, the DNA encoding a mutant full length or truncated polypeptide of each selected CRP1 or B7RP1 polypeptide can be  
25 prepared and introduced into the cells of a patient using either viral or non-viral methods as described above. Each such mutant is typically designed to compete with endogenous polypeptide in its biological role.

30

#### Agonists and Antagonists

The invention also provides for agonists and antagonists of CRP1 or B7RP1 which regulate the activity of either or both molecules. A CRP1 or B7RP1  
35 agonist will stimulate or enhance at least one activity of CRP1 or B7RP1. A CRP1 or B7RP1 antagonist will

008211 044260

partially or completely inhibit at least one activity of CRP1 or B7RP1. Agonists and antagonists may be identified from test molecules which alter the binding of B7RP1 to CRP1.

5           The term "test molecule(s)" refers to the molecule(s) that is/are under evaluation for the ability to bind a CRP1 or B7RP1 polypeptide and thereby alter the binding of B7RP1 to CRP1. Preferably, the test molecule will bind with an affinity constant of at  
10   least about  $10^6$ M.

          A variety of assays may be used to measure binding of B7RP1 to CRP1. These assays may be used to screen test molecules for their ability to increase or decrease the rate or extent of binding of B7RP1 to  
15   CRP1. In one type of assay, a CRP1 polypeptide, preferably a soluble form of CRP1 such as an extracellular domain, is immobilized by attachment to the bottom of the wells of a microtiter plate. Radiolabeled B7RP1 and the test molecule(s) can then be  
20   added either one at a time (in either order) or simultaneously to the wells. After incubation, the wells can be washed and counted using a scintillation counter for radioactivity to determine the extent of binding to CRP1 protein by B7RP1. Typically, the  
25   molecules will be tested over a range of concentrations, and a series of control wells lacking one or more elements of the test assays can be used for accuracy in evaluation of the results. An alternative to this method involves reversing the "positions" of  
30   the proteins, *i.e.*, immobilizing B7RP1 to the microtiter plate wells, incubating with the test molecule and radiolabeled CRP1, and determining the extent of CRP1 binding (see, for example, chapter 18 of *Current Protocols in Molecular Biology*, Ausubel *et al.*,  
35   eds., John Wiley & Sons, New York, NY [1995]).

09728420-148000

As an alternative to radiolabelling, CRP1 or B7RP1 may be conjugated to biotin and the presence of biotinylated protein can then be detected using streptavidin linked to an enzyme, such as horse radish peroxidase [HRP] or alkaline phosphatase [AP], that can be detected colorometrically, or by fluorescent tagging of streptavidin. An antibody directed to CRP1 or B7RP1 that is conjugated to biotin may also be used and can be detected after incubation with enzyme-linked streptavidin linked to AP or HRP

CRP1 and B7RP1 may also be immobilized by attachment to agarose beads, acrylic beads or other types of such inert substrates. The substrate-protein complex can be placed in a solution containing the complementary protein and the test compound; after incubation, the beads can be precipitated by centrifugation, and the amount of binding between CRP1 and B7RP1 can be assessed using the methods described above. Alternatively, the substrate-protein complex can be immobilized in a column and the test molecule and complementary protein passed over the column. Formation of a complex between CRP1 and B7RP1 can then be assessed using any of the techniques set forth above, i.e., radiolabelling, antibody binding, or the like.

Another type of in vitro assay that is useful for identifying a test molecule which increases or decreases formation of an CRP1/B7RP1 complex is a surface plasmon resonance detector system such as the Biacore assay system (Pharmacia, Piscataway, NJ). The Biacore system may be carried out using the manufacturer's protocol. This assay essentially involves covalent binding of either CRP1 or B7RP1 to a dextran-coated sensor chip which is located in a detector. The test compound and the other complementary protein can then be injected into the

chamber containing the sensor chip either simultaneously or sequentially and the amount of complementary protein that binds can be assessed based on the change in molecular mass which is physically associated with the dextran-coated side of the of the sensor chip; the change in molecular mass can be measured by the detector system.

In some cases, it may be desirable to evaluate two or more test compounds together for use in increasing or decreasing formation of a CRP1/B7RP1 complex. In these cases, the assays set forth above can be readily modified by adding such additional test compound(s) either simultaneously with, or subsequently to, the first test compound. The remainder of steps in the assay are as set forth above.

In vitro assays such as those described above may be used advantageously to screen rapidly large numbers of compounds for effects on complex formation by CRP1 and B7RP1. The assays may be automated to screen compounds generated in phage display, synthetic peptide and chemical synthesis libraries.

Compounds which increase or decrease complex formation of CRP1 and B7RP1 may also be screened in cell culture using cells and cell lines expressing either polypeptide. Cells and cell lines may be obtained from any mammal, but preferably will be from human or other primate, canine, or rodent sources. The binding of B7RP1 to cells expressing CRP1 on the surface is evaluated in the presence or absence of test molecules and the extent of binding may be determined by, for example, flow cytometry using a biotinylated antibody to B7RP1. Cell culture assays may be used advantageously to further evaluate compounds that score positive in protein binding assays described above.

#### Therapeutic Uses

Polypeptides of the invention, and agonists and antagonists thereof, may be used to regulate T-cell function. Agonists and antagonists include those molecules which regulate CRP1 and/or B7RP1 activity and either increase or decrease at least one activity of a CRP1 or B7RP1 protein such as one activity associated with T-cell functions, for example, T-cell activation. Agonists or antagonists may be co-factors, such as a protein, peptide, carbohydrate, lipid, or small molecular weight molecule, which interact with either CRP1 or B7RP1 and thereby regulate their activity. Potential polypeptide agonists or antagonists include antibodies that react with either soluble or membrane-bound forms of CRP1 or B7RP1 which comprise part or all of the extracellular domains of the said proteins. Molecules that regulate CRP1 or B7RP1 expression typically include nucleic acids encoding CRP1 or B7RP1 protein that can act as anti-sense regulators of expression.

CRP1 or B7RP1 polypeptides, and agonists and antagonists thereof, may be used in the treatment of autoimmune disease, graft survival, immune cell activation for inhibiting tumor cell growth, T-cell dependent B-cell mediated diseases, and cancer gene immunotherapy. In one embodiment, antagonists or inhibitors of CRP1 and/or B7RP1 function may be beneficial to alleviate symptoms in diseases with chronic immune cell dysfunction. Autoimmune diseases, such as systemic lupus erythematosus, rheumatoid arthritis, immune thrombocytopenic purpura (ITP), and psoriasis, may be treated with antagonists or inhibitors of CRP1/B7RP1. In addition, chronic inflammatory diseases, such as inflammatory bowel disease (Crohn's disease and ulcerative colitis), Grave's disease, Hashimoto's thyroiditis, and diabetes mellitus, may also be treated with inhibitors to

CRP1/B7RP1. As described in Example 18, CRP1-Fc inhibits and B7RP1-Fc enhances, the onset of disease in a rodent rheumatoid arthritis disease model. These opposite effects in this model support an agonistic role for the B7RP1-Fc protein and an antagonistic role for the CRP1-Fc protein. The results also illustrate how T-cell responses can be regulated by manipulation of this pathway and the significance of this pathway in the progression of rheumatoid arthritis. In addition, as described in Example 19, expression of B7RP1-Fc *in vivo* stimulates an inflammatory bowel disease (IBD) phenotype in transgenic mice. This example supports the role for B7RP1/CRP1 in the development of inflammation in the intestine. Therefore, antagonists of the B7RP1/CRP1 pathway may be used to treat human IBD.

Antagonists of CRP1 or B7RP1 may be used as immunosuppressive agents for bone marrow and organ transplantation and may be used to prolong graft survival. Such antagonists may provide significant advantages over existing treatment. Bone marrow and organ transplantation therapy must contend with T-cell mediated rejection of the foreign cells or tissue by the host. Present therapeutic regimens for inhibiting T-cell mediated rejection involve treatment with the drugs cyclosporine or FK506. While drugs are effective, patients suffer from serious side effects, including hepatotoxicity, nephrotoxicity, and neurotoxicity. The target for the cyclosporin/FK506 class of therapeutics is calcineurin, a phosphatase with ubiquitous expression. Since CRP1 expression is restricted to T-cells, inhibitors of CRP1 or B7RP1 may lack the severe side effects observed with the use of the present immunotherapeutic agents.

Antagonists of CRP1 or B7RP1 may be used as immunosuppressive agents for autoimmune disorders, such

tumors cells expressing, or not expressing, the B7RP1 gene. This immunotherapy approach may be used for various leukemias, sarcomas, melanomas, adenocarcinomas, breast carcinomas, prostate tumors, lung carcinomas, colon carcinomas and other tumors. This invention encompasses using the B7RP1 gene in a similar manner to enhance T-cell activation in response to variety of tumors.

As described in Example 14, the phenotype of transgenic mice expressing B7RP1 indicates that B7RP1 is important in the control of antibody production. Agonists and antagonists of B7RP1 protein activity may be useful in therapeutic indications that call for the inhibition or enhancement of antibody production.

For instance, many vaccines act by eliciting an effective and specific antibody response. Some vaccines, especially those against intestinal micro-organisms (e.g. Hepatitis A virus, and Salmonellas), elicit a short-lived antibody response. It is desirable to potentiate and prolong this response in order to increase the effectiveness of the vaccine. Therefore, soluble B7RP1 or activating antibodies to CRP1 may serve as a vaccine adjuvant.

Anti-viral responses may also be enhanced by activators or agonists of the B7RP1/CRP1 pathway. The data in Example 20 indicate that cellular immunity is enhanced by B7RP1-Fc. The enhancement of cellular immune functions by B7RP1-Fc, or other activators of the B7RP1/CRP1 pathway, may also be beneficial in eliminating virus-infected cells. In a complementary fashion, B7RP1-Fc has effects on humoral immune functions that may enhance antibody mediated responses as observed in Example 13 that may function to help clear free-virus from the body.

Enhancement of cellular immune functions, would be desirable in treating cancer or viral

infection. Immune response may be enhanced by activation of the B7RP1/CRP1 pathway optionally in conjunction with activation of a separate immune stimulating pathway. A synergistic effect of B7RP1 and B7.2 in a mouse chronic hypersensitivity model is shown in Example 24. Thus, B7RP1 or an agonist of CRP1 may be administered with B7.1 or B7.2 to stimulate immune functions. In another embodiment, B7RP1 or an agonist of CRP1 may be administered with a CD28 agonist or a CTLA4 antagonist to stimulate immune functions. It is also contemplated that B7RP1 or a CRP1 agonist may be used with other immune stimulating molecules, such as T-cell stimulating molecules, in order to enhance cellular immune functions. In one embodiment, a CRP1 agonist is an antibody which binds CRP1 and stimulates or enhances CRP1 activity.

Conversely, there are a number of clinical conditions that would be ameliorated by the inhibition of antibody production. Hypersensitivity is a normally beneficial immune response that is exaggerated or inappropriate, and leads to inflammatory reactions and tissue damage. Hypersensitivity reactions which are antibody-mediated may be particularly susceptible to antagonism by inhibitors of B7RP1 activity. Allergies, hay fever, asthma, and acute edema cause type I hypersensitivity reactions, and these reactions may be suppressed by protein, antibody or small molecule inhibitors of B7RP1 activity.

Diseases that cause antibody-mediated hypersensitivity reactions, including systemic lupus erythematosus, arthritis (rheumatoid arthritis, reactive arthritis, psoriatic arthritis), nephropathies (glomerulo-nephritis, membranous, mesangiocapillary, focal segmental, focal necrotizing, crescentic, proliferative - tubulopathies), skin disorders (pemphigus and pemphigoid, erythema nodosum),

indicate that activation of the B7RP1/CRP1 pathway leads to IgE production.

The invention provides for use of modulators of B7RP1 or CRP1 to regulate IgE production and to prevent or treat IgE-mediated disorders. In one embodiment, antagonists of B7RP1 or CRP1 are used to partially or completely inhibiting IgE production. The antagonists may be used separately, or in combination, in a treatment regimen for decreasing IgE levels.

Examples of B7RP1 and CRP1 antagonists include nucleic acids, polypeptides, peptides, antibodies, carbohydrates, lipids, and small molecules. In one embodiment, the antagonist is an antibody which binds to B7RP1 and partially or completely inhibits IgE production. In another embodiment, the antagonist is an antibody which binds to CRP1 and partially or completely inhibits CRP1 activity. In another embodiment, a combination of a B7RP1 antagonist and a CRP1 antagonist may be used, for example, B7RP1 antagonist antibody and a CRP1 antagonist antibody. B7RP1 and CRP1 antagonists are administered in amounts effective to decrease IgE production.

The antagonists of the invention may be used to prevent and/or treat disorders characterized by excessive or inappropriate IgE production. By way of example, such disorders include allergic responses such as asthma, food allergies, hay fever, hypersensitivity, and sinus inflammation.

The invention also provides for the use of a B7RP1 antagonist or a CRP1 antagonist in combination with an IgE antagonist to partially or completely inhibit IgE production and to prevent and/or treat disorders characterized by excessive or inappropriate IgE production. As used herein the term "IgE antagonist" refers to a compound capable of disrupting or blocking the interaction of IgE with its high

inhibitors (CD4, IL-4 and IL-5 inhibitors) and IgE antagonists as set forth above.

The following examples are offered to more fully illustrate the invention, but are not construed as limiting the scope thereof.

Example 1

CRP1 cDNA and Amino Acid Sequence

Female C57/ Black 6 mice were sacrificed, and the small intestines were excised, and the Peyer's patches were removed. The small intestine tissue was sliced open and washed to remove mucus and other debris. The epithelial layer, which contains the intestinal intraepithelial cells (iIELs), was released by gentle agitation in RPMI-1640 supplemented with 1 mM dithiothreitol (DTT), for 20 minutes at 37°C. Disassociated cells were passed through a 100  $\mu$  filter, washed in 50 ml of RPMI-1640, mixed to further break up clumps of cells, and then passed through a 40  $\mu$  strainer to obtain single cell populations. These cells were then washed again in a 50 ml volume of RPMI-1640 to ensure the removal of the residual DTT. The tissue was then agitated and washed as before to gather the remaining iIELs. The iIELs were separated from the adipose cells and most epithelial cells on a 3-step Percol gradient, with the iIELs banding at the 40% to 80% interface. These cells were then washed twice with RPMI-1640 to remove traces of Percol, immunostained with CD103 (integrin alpha IEL) antibodies, and separated on a FACs Star cell sorter. These sorted cells were then either used to prepare total RNA directly using Trizol (Gibco BRL, Gaithersburg, MD), or activated overnight on plate-bound activating

antibodies, which crosslink the gamma/delta TCR, alpha/beta TCR, or CD3. The RNA was prepared as above and pooled for use in constructing EST cDNA libraries.

A cDNA clone, designated smil2-00082-a1, contained nucleotide sequence homology to CD28 (Figure 1B). Translation of the sequence and subsequent comparison to known proteins in a public database revealed 19% amino acid identity with murine CD28 (Figure 1B). This low homology was significant because murine CD28 shares only 26% amino acid identity with murine CTLA-4. All of the putative cysteines thought to be critical for intra- and inter-molecular cysteine bonding in the CD28/CTLA-4 family were found to be conserved (amino acid residues 83, 109, and 137; relative to the initiating methionine). In addition, the overall length of the putative open reading frame, and the relative position of the transmembrane domain, were similar to those of both CD28 and CTLA-4. We named the gene CRP1, for CD28-Related Protein-1.

### Example 2

#### Cloning of Human CRP1 cDNA

The nucleic acid sequence encoding human CRP1 protein is identified by the following procedures. A human cDNA library was prepared from enriched lymphocytes from peripheral human blood from normal human volunteers. The lymphocytes were purified and red blood cells were removed by Lymphocyte Separation Media (ICN Pharmaceuticals, Inc., Costa Mesa, CA). The cells were then activated overnight in media containing 10 ng/ml PMA, 500 ng/ml ionomycin, and plate-bound activating antibodies to CD3. Total RNA was prepared from the activated cells by the Trizol method (Gibco/BRL) and poly A RNA was isolated by Dynal bead purification. cDNA was made from the isolated poly A

RNA and size selected for largest cDNA fragments. The size selected cDNA was then ligated into the plasmid pSPORT (Gibco/BRL). DNA encoding human CRP1 protein is obtained by screening the activated lymphocyte cDNA library by either recombinant bacteriophage plaque, or transformed bacteria colony hybridization protocols (Sambrook et al. *Supra*). The phage or plasmid cDNA library are screened using radioactively-labeled probes derived from the murine CRP1 gene clone as described in Example 1 and Figure 1. The probes are used to screen nylon filters lifted from the plated library. These filters are prehybridized for 4 hr at 42°C in 50% formamide, 5X SSPE, 2X Denhardt's solution, 0.5% SDS, and 100 µg/ml salmon sperm DNA and then hybridized for 24 hr at 42°C in 50% formamide, 5X SSPE, 2X Denhardt's solution, 0.5% SDS, 100 µg/ml salmon sperm DNA, and 5 ng/ml mB7RP1 probe. The blots are washed in 2X SSC, 0.1% SDS for 10 min at RT, 1X SSC, 0.1% SDS for 10 min at 50°C, 0.2X SSC, 0.1% SDS for 10 min at 50°C, then 0.2X SSC for 10 min at 50°C again. Inserts obtained from any human CRP1 clones are sequenced and analyzed as described in Example 1.

### Example 3

#### B7RP1 DNA and Amino Acid Sequence

A cDNA clone, designated sm11-00003-g5, contained nucleotide sequence homology to B7.1 (CD80) and B7.2 (CD86). Translation of the sequence (Figure 2A) and subsequent comparison to known proteins in a public database revealed 20% amino acid identity with murine B7.1 (Figure 2B). This low homology was significant because murine B7.1 shares only 24% amino acid identity with murine B7.2. Despite this low homology, critical cysteine residues are conserved

between the open reading frame of this clone and murine B7.1 and B7.2 at residues 62, 138, 185, and 242 (relative to the initiating methionine, Figure 2B). The approximate mature protein length and the location of the transmembrane region relative to the carboxy terminus are also similar in the putative ORF of this clone, as compared to B7.1 and B7.2. We named the gene B7RP1, for B7-Related Protein-1.

10

Example 4

## Cloning of Human B7RP1 cDNA

A Genbank blast homology search (GCG, University of Wisconsin) using murine B7RP1 sequence (see Figure 2) retrieved a clone (AB014553) containing a 4358 bp sequence with 1679 bp of ORF. PCR cloning primers were designed according to this sequence. A DNA fragment of 1313 bp was obtained by 5' and 3' RACE using Human Lymph Node Marathon-Ready™ cDNA (Clontech, Palo Alto, CA) according to the manufacturer's recommended procedures. Primers used for full length human B7RP1:

2083-75	ACC ATG CGG CTG GGC AGT CCT GGA
25	(SEQ ID NO: 25)
2083-76	TGG TGA CCT ACC ACA TCC CAC AG
	(SEQ ID NO: 26)
2083-77	TCC GAT GTC ATT TCC TGT CTG GC
	(SEQ ID NO: 27)
30 2083-78	GCT CTG TCT CCG GAC TCA CAG CCC
	(SEQ ID NO: 28)
2113-29	GTG GCA GCA AAC TTC AGC GTG CCC GTC G
	(SEQ ID NO: 29)
2113-30	CCC AAC GTG TAC TGG ATC AAT AAG ACG G
35	(SEQ ID NO: 30)
2113-31	GCG TGC TGA GGA TCG CAC GGA CCC CCA G

(SEQ ID NO: 31)

Primers 2083-75 and 2083-76 were used to amplify the 5' end of the gene using RACE protocols. Primers 2083-77, 2083-78, 2113-29, 2113-30, and 2113-31, were used to amplify the 3' end of the gene using RACE protocols.

The resulting nucleotide sequence contained an ORF of 288 amino acid residues beginning at the methionine. The predicted mature human B7RP1 amino acid sequence was then compared to the mature mouse B7RP1 amino acid sequence (Figure 3B) and found to share 48% amino acid identity. This homology is significant because the homology between species is low with the CD80 (B7.1) gene, in fact, the mouse and human CD80 share only 41% amino acid identity. Importantly, the human B7RP1 protein conserve critical cysteine residues necessary for Ig loop structures (amino acid residues 16, 92, 138, 194, and 195, relative to the mature protein, Figure 3B). In addition, the overall length and position of the transmembrane domain are consistent with a human B7RP1 homolog.

#### Example 5

##### Expression of B7RP1 RNA

RNA in situ hybridization using RNA probes to the B7RP1 gene. Adult mouse tissues were fixed in 4% paraformaldehyde, embedded in paraffin, and sectioned at 5  $\mu$ m. Prior to in situ hybridization, tissues were permeabilized with 0.2M HCL, followed by digestion with Proteinase K, and acetylation with triethanolamine and acetic anhydride. Sections were hybridized overnight at 55°C with a 969 base <sup>33</sup>P-labeled riboprobe corresponding to nucleotides 1 to 969 of the mouse B7RP1 sequence. Excess probe was removed by RNase

digestion, followed by a series of washes in buffer with decreasing salt concentrations, and then a high stringency wash in 0.1X SSC at 55°C. Slides were dipped in Kodak NTB2 emulsion, exposed at 4°C for 2-3 weeks, developed, and counterstained with hematoxylin and eosin. Sections were examined with darkfield and transmitted light illumination to allow simultaneous evaluation of the tissue morphology and the hybridization signal.

10           The analysis of the B7RP1 RNA by in situ hybridization showed that the B7RP1 RNA was highly expressed in areas of lymphoid maturation and lymphocyte activation. B7RP1 RNA was expressed in the lymphoid tissues of the thymus, Peyer's patches of the intestine, spleen, and lymph nodes. Expression within these lymphoid tissues demonstrated that the B7RP1 RNA was generally expressed in the areas of B-cell and other APC involvement. These regions include the medulla area of the thymus, the primary follicles of the lymph nodes, and the follicular and dome regions of the Peyer's patches. The expression of B7RP1 RNA is highly specific to the regions of APC involvement in lymphoid tissues.

25           The analysis of several non-lymphoid tissues also revealed B7RP1 expression in regions of APC involvement. In the lung, B7RP1 expression was found in the submucosal regions, consistent with a function in antigen processing. In the small intestine, B7RP1 RNA was found in the lamina propria. Notably, we found a section of damaged liver, which showed lymphocyte infiltration that overlapped with the expression of B7RP1 RNA. This coincidence of B7RP1 expression with lymphocyte accumulation in response to tissue damage strongly indicates that B7RP1 is involved in lymphocyte activation.

Example 6

## Expression of CRP1 RNA

RNA in situ hybridization using RNA probes to  
5 the CRP1 gene. Mouse tissues were prepared as in  
Example 5. Tissue permeabilization, probe  
hybridization, slide treatment, and tissue staining  
were as described in Example 5. Sections were  
hybridized overnight at 55°C with a 603 base <sup>33</sup>P-  
10 labeled riboprobe corresponding to nucleotides 1 to 603  
of the mouse CRP1 sequence. Sections were examined  
with darkfield and transmitted light illumination to  
allow simultaneous evaluation of the tissue morphology  
and the hybridization signal.

15 Lymph nodes from normal mice or a mouse  
treated with oxazolone were sectioned and analyzed for  
CRP1 RNA expression. The sensitized mouse lymph node  
showed greater expression of CRP1 RNA than the normal  
mouse lymph node. The expression of CRP1 was in the  
20 paracortex, a region of T-cell activity. Therefore,  
the expression of CRP1 RNA is consistent with that of  
T-lymphocyte expression and is up-regulated upon T-cell  
activation.

25

Example 7Expression and Purification of  
CRP1-Fc and B7RP1-Fc Fusion Proteins

30 To construct the DNA expression vector for  
the CRP1- Fc fusion protein, the coding sequence for  
the first amino terminal 147 amino acids of the CRP1  
was fused, inframe, to the coding sequence for the  
carboxy terminal 235 amino acids of the human Fc gene  
35 (isotype IgG1) and ligated within the polylinker

sequence of pcDNA3 (pcDNA3/CRP1-Fc). To construct the DNA expression vector for the B7RP1- Fc fusion protein, the coding sequence for the first amino terminal 269 amino acids of the B7RP1 was fused, inframe, to the coding sequence for the carboxy terminal 235 amino acids of the human Fc gene (isotype IgG1) and ligated within the polylinker sequence of pcDNA3 (pcDNA3/B7RP1-Fc). The coding sequences of both CRP1 and B7RP1 contained sequences from the N-terminus of each protein up to, but not including, the putative transmembrane region of each protein. 293T-cells were transfected with either pcDNA3/CRP1-Fc or pcDNA3/B7RP1-Fc using the FuGene 6 transfection reagent (Roche Molecular Biochemicals, Indianapolis, IN). After four days, the conditioned media were collected and the Fc fusion proteins were purified by batch chromatography using Protein A Sepharose (Pharmacia). Fc fusion proteins bound to the column were eluted with three column volumes of Immunopure Gentle Elution Buffer (Pierce), and then were dialyzed against 150 volumes of 20 mM HEPES, 100 mM NaCl, pH 7.5. The dialyzed protein was concentrated using Macrosep centrifugal concentrates, 30 kD MWCO (Pall Filtron), and the protein concentrations were calculated using extinction coefficients derived from the amino acid sequence of each protein. Expression of CRP1-Fc fusion protein is shown in Figure 4A, expression of B7CPR1-Fc fusion protein is shown in Figure 4B.

30

Example 8Identification of CRP1 and B7RP1  
as a Receptor-ligand Pair

In order to determine whether the novel proteins were part of the same costimulatory pathway as

00822T" 02482460

5

10

25

30

ACAS analysis of the cells that bound the various Fc fusion proteins demonstrated that the B7RP1 protein bound CRP1, but not the proteins in the known costimulatory pathway, CD28 or CTLA-4. Conversely, CRP1 interacted with B7RP1, but not B7.2, a component in the known pathway. (See Figure 5). These results strongly indicate that CRP1 and B7RP1 represent a novel receptor-ligand pair, analogous to CD28 and B7.2. However, since CRP1 and B7RP1 do not interact with B7.2, CTLA-4, or CD28, they are separate and independent of the known costimulatory pathway.

#### Example 9

##### 15 Identification of Cells Expressing B7RP1 Receptors

The B7RP1-Fc fusion protein was utilized to detect cells that expressed receptors to B7RP1, presumably including the CRP1 protein (see Example 6), by FACS analysis. Spleens were removed from female C57/Black 6 mice, ground on 100 micron mesh filters to release the lymphocytes, passed through 70 micron filters, and then washed in 50 ml of RPMI-1640. They were pelleted at 1500 rpm, resuspended in fresh RPMI, mixed to break up the clumping cells, and passed through a 40 micron filter. T-cells to be activated were seeded into 6 well plates in RPMI-1640, 5% FBS, 1XPSG, PMA, ionomycin, and incubated at 37°C, 5% CO2 overnight. T-cell activation was checked by visual confirmation after 12 hr.

Activated spleen cells for immunostaining were washed in PBS, 0.5% BSA (Path-ocyte 4, ICN Pharmaceuticals) wash buffer, resuspended, and then aliquoted in 100  $\mu$ l volumes. 15  $\mu$ g/ml of either the CRP1-Fc fusion protein or the B7RP1-Fc fusion protein was added (1.5  $\mu$ g/sample) as appropriate, and then the

mixtures were incubated on ice for 30 min with occasional mixing. The cells were washed twice in 5.0 ml of wash buffer. Binding of the fusion proteins was visualized with 2  $\mu$ g of goat-anti-human (GaHuFc-FITC) conjugated secondary antibody in a 100  $\mu$ l volume for cell staining. Cell marker antibodies conjugated with PE were added with the GaHUFc-FITC, as well as control isotype-PE conjugated antibody controls where indicated (rat isotype). The samples were incubated on ice and washed as before. Visualization was done by FACScan analysis with gating on the lymphocyte populations. Double staining with CD4+ antibodies and the B7RP1-Fc fusion protein indicated that the cells expressed both the CD4 marker and the receptor to B7RP1, presumably CRP1 (Figure 6). Similarly, double staining with CD8+ antibodies and the B7RP1-Fc fusion protein demonstrated that cells expressed both CD8 and B7RP1 receptors (Figure 6). We could not reliably detect such double staining cells in inactivated splenocyte preparations. Since CD4 and CD8 are T-lymphocyte markers, we can postulate that CRP1 is expressed on activated CD4+ and CD8+ T-cells. These data are consistent with the increased expression of CRP1 RNA in the T-cell regions of lymph nodes from sensitized mice as compared to normal mice (Example 6).

#### Example 10

##### Identification of Cells Expressing CRP1 Ligands

The CRP1-Fc fusion protein was utilized to detect cells that expressed ligands to CRP1, presumably including the B7RP1 protein (see Example 8), by FACS analysis (Figure 7). Splenocytes were prepared as in Example 8, except the 12 hr T-cell activation step was omitted and the cells were directly analyzed. Splenocytes were double stained with CD45R (B220)

marker antibodies and the CRP1-Fc fusion protein. Cells were detected that expressed both the CD45R B-cell marker and the putative ligands for CRP1, presumably including B7RP1 (Example 8). Therefore, we  
5 conclude that B7RP1 is expressed on B-cells, a type of antigen-presenting cell. These data are consistent with the expression of B7RP1 RNA in B-cell regions of various lymphoid tissues (Example 5).

FACS analysis of the expression of B7RP1 on  
10 peritoneal macrophages (Figure 8). Peritoneal cells were collected by local lavage from a normal mouse and washed before being incubated with the CRP1-Fc fusion protein or the Fc protein as a control or with the F4/80 monoclonal antibody (which detects an antigen  
15 specific for macrophages) or an irrelevant, isotype-matched control monoclonal antibody. Cells were then washed again and incubated with goat-anti-human Fc-FITC conjugated antibody. After further washing, cells were assessed in a FACS analyzer for their light scattering  
20 and fluorescence staining properties. Peritoneal cells were first distinguished in subsets on the ground of their light scattering properties (Figure 8A). Macrophages were identified in region 5 (R5) because of their ability to strongly scatter light forward (FSC)  
25 and sideways (SSC) and because of their positive staining for the F4/80 antigen, a marker for macrophages (Figure 8B). Macrophages in region 6 (R6) were singled out on the basis of their less intense staining for the F4/80 antigen and found to be stained  
30 by the CRP1-Fc fusion protein (Figure 8C). These data indicate that ligands for CRP1, possibly including B7RP1, are expressed on macrophages, a professional antigen presenting cell. This is consistent with CRP1 and B7RP1 function in T-lymphocyte activation.

35

Example 11

003217 02492260

In vitro Inhibitory Activity of the B7RP1-Fc Fusion  
Protein on ConA-Stimulated T-Lymphocytes

Mouse splenocytes were prepared as in Example  
5 8 and enriched for T-lymphocytes by negative selection  
(R and D Systems, Inc., Minneapolis, MN)). 200,000  
splenocytes were used in T-cell proliferation assays in  
a 96-well round-bottom plate. Cells were incubated for  
1 hr with media (no adds), CRP1-Fc, B7RP1-Fc, or B7.2-  
10 Fc, fusion proteins as indicated Figure 9. Media (no  
adds), or Con A at various concentrations were added as  
indicated in at the bottom of Figure 9. The cells were  
then incubated at 37°C and 5% CO<sub>2</sub>. After 42 hr, cells  
were pulsed with 3H-thymidine for 6 hr, harvested and  
15 incorporated radioactivity determined. Average CPM and  
standard deviation from triplicate samples are  
represented in Figure 9.

The Fc fusion proteins did not demonstrate  
significant T-cell stimulatory or inhibitory activity  
20 by themselves, however, in the presence of 1 µg/ml and  
3 µg/ml Con A, both the B7RP1-Fc and the known B7.2-Fc  
fusion proteins showed significant inhibitory activity  
(Figure 9). At high concentrations (10 µg/ml), Con A  
stimulation results in cell death, presumably through  
25 over-activation of the T-cells. Addition of either  
B7RP1-Fc or B7.2-Fc, significantly protected the cells  
from the detrimental effects of high concentrations of  
Con A. In both inhibitory and protective functions,  
the effect by B7RP1-Fc protein was greater than B7.2-Fc  
30 protein on the Con A stimulated cells. These data  
indicate that the B7RP1 protein functions to regulate  
T-cell proliferation.

Example 12

35        Systemic delivery of B7RP1-Fc fusion protein in  
transgenic mice

follicular hyperplasia seen as enlarged secondary follicles (Fig. 10B-11B) with large germinal centers containing mostly B220+ B cells (Fig. 11D) and a few scattered CD3+ T cells (Fig. 11F). The paracortical (CD3+ T-cell) area was also moderately enlarged (Fig. 11B-11F) and the medullary sinuses had slightly increased numbers of fleshy macrophages (sinus histiocytosis). The most conspicuous change in the nodes was present in the medullary cords, which were mildly to markedly expanded by large numbers of well-differentiated plasma cells in the B7RP1-Fc transgenic mice (Fig. 10D). In transgenic mouse #40, small numbers of scattered Russell bodies (i.e. plasma cells with prominent, large, round, intracytoplasmic vesicles containing immunoglobulins) were also found in the medullary cords (Fig. 10D). Interestingly, the other internal and peripheral lymph nodes (e.g. cervical, inguinal) had similar morphologic features of reactive lymphoid hyperplasia suggestive of a systemic response. These findings are consistent with a chronic, ongoing immune stimulation with enhancement of the humoral immune reaction, which leads to B cell proliferation and terminal differentiation into plasma cells.

The spleen of B7RP1-Fc transgenic mice had variably enlarged white pulp areas with moderate reactive lymphoid hyperplasia involving particularly the B-cell secondary follicles with prominent germinal centers and periarteriolar T-cell sheaths when compared to the control mice (Fig. 10E-10F). Another conspicuous finding in B7RP1-Fc transgenic mice was minimal to mild plasmacytosis in the marginal zone surrounding the white pulp areas and in the adjacent red pulp. Transgenic mouse #6 had a few scattered Russell bodies (Fig. 10F, inset). The red pulp had mild to moderate extramedullary hematopoiesis, which

was comparable to that seen in the control mice (Fig. 10E).

The small intestinal Peyer's patches were mildly to markedly enlarged in the B7RP1-Fc transgenic mice over those of the control mice (Fig. 10G) and had very large follicles with prominent germinal centers, particularly in transgenic mouse #40 and #32 (Fig. 10H). In addition, there was a minimal (in #32) to mild (in #8 and #33) increase in the numbers of lymphocytes and plasma cells (admixed with a mild eosinophil infiltrate in the ileum of mouse #32) in the thickened lamina propria layer of the mucosa, which was present in the small intestine, but more prominent in the colon of the transgenic mice. The large intestinal lymphoid aggregates (GALT) were also slightly more prominent in some B7RP1-Fc transgenic mice (particularly mouse #8 and #2) than in the control group.

Generally, the other tissues examined, including the thymus, bone marrow, liver, lung, heart, pancreas, kidneys, adrenal gland, thyroid, parathyroid, trachea, reproductive organs, urinary bladder, mammary gland, skin, skeletal muscle, peripheral nerve, brain, esophagus, stomach, small and large intestine, bone (femur/tibia), stifle joint, white and brown fat appeared normal and comparable to the background changes detected in the control mice.

The data from this study demonstrate that overexpression of the B7-related protein Fc chimera (B7RP1-Fc) in transgenic mice induces a phenotype characterized by prominent reactive lymphoid hyperplasia detected in the spleen, peripheral and internal lymph nodes, and gut-associated lymphoid tissue, as follicular hyperplasia, expansion of T-cell areas and conspicuous plasmacytosis accompanied by hyperglobulinemia in some animals. The plasmacytosis

is accompanied by higher levels of circulating IgG (mean  $\pm$  SD = 597  $\pm$  298 mg/ml in transgenic mice vs. 209  $\pm$  80 mg/ml in control littermates, n = 7, P < 0.05, t test), in particular IgG2a (217  $\pm$  100 mg/ml vs. 75  $\pm$  29 mg/ml, n = 7, P < 0.01, t test). The induction of IgG2a is normally associated with a Th1 cytokines such as IFN-g. Thus, B7RP1 induces B- and T-cell proliferation and stimulates B-cells to differentiate into plasma cells and to produce immunoglobulin.

These changes are consistent with a persistent systemic immune response with hyperstimulation of the humoral arm of the immune system which results in B cell stimulation, proliferation, and differentiation to antibody-producing plasma cells throughout the lymphoid organs examined.

We conclude from the marked lymphoid hyperplasia demonstrated in the B7RP1-Fc transgenic mice that B7RP1 protein has significant *in vivo* biological activity, related to immune system stimulation.

#### Example 14

##### Cloning of human B7RP1

Normal human circulating peripheral lymphocytes were separated from red blood cells using Lymphocyte Separation Medium (ICN Pharmaceuticals). The T-cells were then activated with 10  $\mu$ g/ml plate bound anti-CD3 antibody (Immunotech, Westbrook, ME), 10 ng/ml PMA, and 500 ng/ml ionomycin overnight (16 hours) at 37°C and 5% CO<sub>2</sub>. Total RNA was then prepared from the cells using TRIzol reagent (Gibco BRL). The cells were pelleted by centrifugation and the cell pellet was resuspended in 1 ml TRIzol reagent for each 5 X 10<sup>6</sup> cells and incubated at room temperature for 5 min. 0.2

5

15  
20  
25  
30

35

[illegible]

125 ng of the DNA fragment was labeled with <sup>32</sup>P dCTP (Amersham) following the Redi-Prime 2 (Amersham) random prime labeling system protocol. The colony lift filters were then allowed to hybridize with the probe at 42°C in the following buffer overnight at 42°C; 50% formamide, 5X SSPE, 2X Denhardt's solution, 0.5% SDS, 100 mg/ml ssDNA. The specific activity of the probe was 2.38 X 10<sup>9</sup> cpm/μg DNA, in approximately 2 ng labeled probe per ml hybridization buffer. The probe was removed and saved for the next round of screening. The filters were then washed in 2X SSC, 0.1% SDS RT for 15 min, followed by 1X SSC, 0.1% SDS at 55°C for 15 min, and 1X SSC, 0.1% SDS at 60°C for 10 min. The filters were wrapped in plastic and exposed to autoradiography film overnight at -80°C with 2 enhancing screens. Three independent positive clones were identified. Exposures were aligned to the bacterial plates and the positive clones scraped, diluted and replated on LB plates with ampicillin 100μg/ml, grown overnight as before and the colonies were lifted, prepared, and probed as described previously. Three independent clone colonies were isolated, the DNA was isolated, and DNA sequenced for each clone in triplicate.

35           The full-length of the human B7RP1 protein is  
302 amino acids. The polypeptide length and relative

[illegible]

position of the transmembrane domain, is consistent with other B7 family members. The human B7RP1 gene has 43% amino acid identity with the mouse clone. This degree of homology is significant since the mouse and human CD80 proteins are only 41% identical. Notably conserved between the mouse and human genes are the cysteine residues at amino acid positions 37, 113, 158, 215, and 216.

10

Example 15

## Cloning of human CRP1

15

A Genbank blast homology search (GCG, University of Wisconsin) using murine B7RP1 sequence (see Figure 2) retrieved a genomic clone (Gen Bank Assession NO. AQ022676) containing a 104 bp sequence that showed high homology with the murine CRP1 gene. PCR cloning primers were designed to overlap this sequence.

20

5'-GCA TAT TTA TGA ATC CCA-3' (SEQ ID NO: 34)  
5'-ACT ATT AGG GTC ATG CAC-3' (SEQ ID NO: 35)

25

Using the above primers, a 151 bp DNA fragment of the murine CRP1 was PCR amplified using the murine CRP1 plasmid described in Figure 1 and Example 1 as template. 125 ng of the DNA was labeled with 32P dCTP (Amersham) following the Redi-Prime 2 (Amersham) random prime labeling system protocol. The colony lift filters from human peripheral blood libraries described in Example 15 were then allowed to hybridize with the probe in the following hybridization buffer overnight (15 hr) at 41°C, 50% formamide, 5X SSPE, 2X Denhardt's solution, 0.5% SDS, 100 µg/ml ssDNA. The specific activity of the probe was  $3.52 \times 10^9$  cpm/µg DNA, 1.5 ng labeled probe/ml hybridization buffer. The probe was

35

pulled off and saved for the next round of screening. The filters were then washed in 2X SSC, 0.1% SDS at RT for 10 min, followed by 1X SSC, 0.1% SDS at 37°C for 7 minutes, 40°C for 7 minutes, 44°C for 7 minutes, then 50°C for 7 minutes, continually monitoring the rate at which the filters were releasing the labeled probe. The filters were wrapped in plastic and exposed to film overnight at -80°C with 2 enhancing screens. This method revealed 9 possible independent positive clones. Exposures were aligned to the bacterial plates and the positive clones scraped, deposited into 200  $\mu$ l SOC, 2 serial dilutions of 1:10 were performed and 70  $\mu$ l from the second dilution was replated on LB plates containing ampicillin at 100  $\mu$ g/ml and grown overnight as before. The colonies were lifted, prepared and probed as before. Eight independent clones were isolated and DNA prepared by the Qiagen miniprep method.

00827 0248260  
A cDNA clone containing an open reading frame of 199 amino acids was obtained (Figure 13A). This cDNA clone contained nucleotide and amino acid homologies to the murine CRP1 clone described in Example 1 and Figure 1. The nucleotides corresponding to the open reading frame of this human clone was 77% identical to the murine CRP1 gene. Translation of the human sequence and subsequent comparison with the murine CRP1 protein revealed 69% amino acid identity with the murine protein (Figure 13B). In addition, the motif between amino acids 114 to 119, "FDPPPF", was conserved between the murine and human CRP1 genes. This motif corresponds to the "MYPPPY" motif in murine and human CD28 that is essential for B7 protein interaction. Furthermore, the cysteines at amino acid positions 42, 109, and 141 are also conserved. These cysteines correspond to cysteines in CD28 and CTLA-4 at

c7  
are involved in Ig loop formation and intermolecular  
disulfide dimerization. The close similarity with  
murine CRP1, and structural similarities with the CD28  
homology family, indicate that this is the human CRP1  
5 homolog.

#### Example 16

CRP1 is expressed on resting memory T-lymphocytes

10

In order to study CRP1 expression on memory  
T-cells, splenic T-cells were collected from 6-7 month  
old mice. These cells were double-stained using B7RP1-  
Fc labeled by an FITC-conjugated anti-human Fc antibody  
15 and a PE-conjugated antibody to either CD44, CD45RB, or  
CD69. Staining with the B7RP1-Fc fusion protein  
detects expression of CRP1 protein on these T-cells.  
Older mice show more CRP1+ splenic T-cells than younger  
mice. Interestingly, a conspicuous number of these  
20 cells are CD44 high (Fig 14a) and CD45RB low (Fig 14b),  
a profile typical of memory T-cells. These CRP1+  
memory T-cells are in a resting state, since they do  
not express the activation marker CD69 (Fig. 14c). The  
expression of CRP1 on memory T-cells indicates that  
25 CRP1 has costimulatory functions on memory T-cells.

#### Example 17

*In vitro* T-cell costimulation  
inhibited by antibodies to B7RP1.

30

To determine if the B7RP1 protein has  
functional relevance to T-cells, we incubated CD3+ T-  
cells with the B7RP1-Fc fusion protein and an anti-CD3  
antibody in an *in vitro* proliferation assay. Rabbit  
35 anti-mouse B7RP1 polyclonal antibodies or rat anti-  
mouse B7RP1 monoclonal antibodies were then used to

[illegible]

5 Three New Zealand white rabbits (5-8 lbs.  
initial weight) were injected IM with murine B7RP1  
protein. Each rabbit was immunized on day 1 with 150 µg  
of murine B7RP1 protein emulsified in an equal volume  
of Hunters Titer Max complete adjuvant. Further boosts  
10 (days 14 and 28) were performed by the same procedure.  
Antibody titers were monitored by EIA. After the  
second boost, the antisera revealed moderate antibody  
titers. A 30ml production bleed was then obtained from  
each animal. This was repeated each week for 6 weeks.  
15 Polyclonal antibodies were then purified by protein-A  
agarose chromatography, followed by negative selection  
Fc protein affinity chromatography and positive  
selection by B7RP1-Fc affinity chromatography.

Rat anti-murine B7RP1 monoclonal antibodies were generated as described in Practical Immunology, second edition (1980; L. Hudson and F.C. Hay; Blackwell Scientific Publications; St. Louis, MO). Briefly, Lou  
25 rats (Harlan; Indianapolis, IN) were injected intraperitoneally with muB7RP1-Fc fusion protein emulsified in Freund's Adjuvant at 4 week intervals. Three days prior to fusion, rats were boosted intravenously with soluble muB7RP1. On the day of  
30 fusion, the animal was sacrificed under carbon dioxide and the spleen removed aseptically. Single cell suspension was generated using a tissue stomacher. Both splenocytes and Y3-Ag1.2.3 myeloma cells (American Type Culture Collection; Rockville, MD) were washed in  
35 serum-free media then fused by the addition of

polyethylene glycol (PEG 1500; Boehringer Mannheim Biochemicals; Indianapolis, IN). The cells were rinsed once, resuspended in serum-containing media, and plated into 96-well tissue culture plates. Ten to 12 days later, media from each well was tested for specific antibody to B7RP1 via a direct Enzyme-linked Immunosorbent Assay (EIA). Cells from wells indicating potential binding were grown to 10 ml cultures and frozen in liquid nitrogen. Media from each culture was further tested in flow cytometry and in a functional T-cell proliferation assay. Those determined to be of interest by these methods were plated to single cell colonies, selected again by EIA, and final cell lines maintained for antibody generation. Antibodies were purified from the cell media by protein A agarose chromatography.

#### T-cell preparation and T-cell proliferation assay

T-cells from the spleens of C57Bl/6 mice (8-12 week-old females, Charles River Laboratories) were purified by negative selection through a murine T-cell enrichment column (R&D Systems). The T-cells were then either used directly or further purified by antibody and complement lysis as follows. Cells were resuspended ( $2.5 \times 10^6$  cells/ml) in RPMI medium containing antibodies (all at 10  $\mu$ g/ml and from Pharmingen) against murine CD11b (Clone M1/70), NK-1.1 (Clone PK136), CD8a (Clone 53-6.7), I-A<sup>b</sup> (Clone M5/114.15.2), CD11c (Clone HL3), and the B220 antigen (Clone RA3-6B2). The cells were then incubated on ice for 30 min, pelleted at 1200 rpm, resuspended in 4:1 vol/vol of RPMI: rabbit complement (Sigma, #S-7764), and incubated for an additional 30 min at 37°C. The cells were pelleted again, and the complement treatment was repeated. Before plating, the cells were washed with RPMI containing 10% FCS. U-bottomed 96 well

plates were coated with an anti-CD3 antibody (Clone 145-2C11, Pharmingen) at concentrations ranging between 0 and 1.2 µg/ml), and anti-human IgG Fab<sub>2</sub> (Sigma, 12.5 µg/ml) overnight at 4°C, followed by a 6-9 hr incubation at 37°C. T-cells (1x 10<sup>5</sup>/well) were cultured in the absence or presence of various Fc fusion proteins for 48 hr and were pulsed during the last 18 hours with 1 µCi of <sup>3</sup>H-thymidine. Control Fc proteins included a fusion protein of OPG and Fc and a nonfused Fc protein fragment. The cells were then harvested and the incorporated radioactivity was counted. B7RP1-Fc co-stimulates T-cells to proliferate in a dose-dependent fashion (Fig. 15a), and an anti-B7RP1-Fc antibody specifically inhibits this co-stimulation dose-dependently (Fig. 15b).

#### Example 18

Inhibitors of the CRP1/B7RP1 pathway decrease the onset of rheumatoid arthritis induced by collagen.

Collagen-induced arthritis (CIA) is an animal model of autoimmune polyarthritis in rodents and primates that has many similarities with rheumatoid arthritis in humans. Immunization with heterologous species of type II collagen (CII) induces an autoimmune response to CII that leads to the development of CIA in susceptible mouse strains. Congenic strains of mice with H-2<sup>f</sup> and H-2<sup>g</sup> are highly susceptible to CIA. CIA is mediated by the synergistic effects of both CII-reactive T-cells and antibodies. Porcine CII (Nabozny et al., Autoimmunity 20, 51-58 (1995)) was dissolved in 0.01N acetic acid at a concentration of 2mg/ml and then was emulsified at a 1:1 ratio with CFA (Difco). Arthritis susceptible B10.RIII (H-2<sup>f</sup>) mice (Jackson

00822T 0242360

Laboratories, Bar Harbor, ME) were immunized with 100  $\mu$ l of emulsion intradermally at the base of the tail. Mice were monitored 2-3 times per week for the development of arthritis. Arthritis severity was  
5 determined using a grading system for each paw as follows: 0: no arthritis; 1: redness or swelling in 1-3 toes; 2: severe swelling of paw; 3: joint ankylosis. The score of each limb was summed to give a severity range from 0 to 12 for each animal.

10 Mice were injected with 100ug (in 200  $\mu$ L) of protein intraperitoneally twice per week. The treatment was begun 1 day after immunization with porcine CII and was stopped at day 52 post-immunization. The experiment was conducted in  
15 treatment groups of 10 mice, and animals with scores of 1 or above were scored as positive. The results are shown in Figure 16 and Table 1.

TABLE 1

20 Effect of CRP1, B7RP1, CTLA-4, and B7.2 Fc fusion proteins on the onset of arthritis

	<u>Treatment groups</u>	<u>Mean+/-s.d. day of onset</u>
25	CTLA4-Fc	60.0 $\pm$ 0.0
	CRP1-Fc	48.9 $\pm$ 13.2
	B7.2-Fc	28.4 $\pm$ 14.1
	B7RP1-Fc	33.9 $\pm$ 16.6
30	PBS	37.7 $\pm$ 17.1

In mice treated with CRP1-Fc fusion protein, the onset of arthritic symptoms were delayed by  
35 approximately 10 days as compared to the PBS treated mice. This demonstrates that the inhibition of the

00928420 112800

CRP1/B7RP1 pathway can alleviate disease symptoms in this mouse model of rheumatoid arthritis.

Mice treated with B7RP1-Fc or B7.2-Fc showed an earlier onset of disease (Table 1 and Figure 16a) with an increase in arthritic severity (Figure 16b) as compared to the PBS-treated controls. This indicates that the B7RP1-Fc fusion protein enhances the T-cell immune response. Such activity may be useful in generating anti-tumor immunity *in vivo*.

The opposite effects by CRP1-Fc and B7RP1-Fc in this mouse model of rheumatoid arthritis indicate that the pathway can be manipulated to either enhance or inhibit the disease progression. Targeting the CRP1 protein with soluble B7RP1-Fc enhances the disease, while the interaction of soluble CRP1-Fc with B7RP1 inhibits the disease symptoms.

#### Example 19

B7RP1-Fc induces an inflammatory bowel disease phenotype in transgenic mice.

Persistent overexpression of the B7-related protein (B7RP1-Fc) in 22-to-25-week-old transgenic mice (Example 12) induces a striking phenotype of inflammatory bowel disease (IBD) with marked thickening and chronic inflammation of the small and large bowels (enterocolitis) and weight loss in some animals. Histologically, the most severe inflammatory changes were found in the proximal and distal colon, with milder changes in the small intestine. The proximal colon was markedly thickened with fissuring ulceration, transmural inflammation, and hypertrophy of the colonic mucosa, while the distal colon had diffuse mucosal hypertrophy (or focal erosion and glandular atrophy)

without ulceration. The proximal small intestine had mild to marked mucosal hypertrophy with milder inflammatory changes, while the distal small intestine (ileum) had mild mucosal hypertrophy in some animals and atrophy in other mice. The intestinal changes were most severe and consistently found in the female B7RP1 transgenic mice, but were also observed in several of the male transgenic mice in this study.

It is interesting to note that the histologic features found in the proximal colon, including the fissuring ulceration and the transmural chronic granulomatous inflammation with multinucleated giant cells, more closely resemble those seen in Crohn's disease than ulcerative colitis in humans. Morphologically, this colitis also mimics the IBD described in mice deficient in interleukin-10, which develop wasting, anemia, and enterocolitis affecting their entire intestinal tract (Kuhn et al. 1993; Sartor 1995; Leach et al. 1999). As in the IL-10 knockout mice, the initial changes in the B7RP1-Fc transgenic mice consist of mild, focal infiltrates of inflammatory cells in the lamina propria without colonic epithelial hyperplasia (Example 13). In older mice, the affected colonic segments become thickened due to glandular hypertrophy/hyperplasia and chronic inflammation. The proximal and distal colons of the B7RP1-Fc mice had moderate to severe colitis with histologic features of inflammatory bowel disease (IBD). The affected segments of the proximal colon (Figure 17B-17D) were diffusely thickened, due to prominent glandular epithelial hypertrophy and hyperplasia with elongation and dilatation of the mucosal glands (Fig. 17B), which had increased numbers of mitotic figures and rare crypt abscesses, but retained goblet cells with mucin (Fig. 17D). The mucosa had diffuse chronic inflammation in the lamina propria, which in some animals extended

transmurally to involve the underlying layers of the gut wall, including the submucosa, muscularis, serosa, and the adjacent mesenteric fat tissue (Fig. 17B-17C). The inflammatory infiltrates consisted of lymphocytes (predominantly CD3+, CD44+ T-cells), plasma cells, and epithelioid macrophages (Fig. 17F) mixed with some neutrophils and occasional multinucleated giant cells (Fig. 17E), characteristic of chronic granulomatous inflammation. Lymphoid aggregates (mostly B220+ cells mixed with small numbers of CD3+ cells) were also present in the mucosa and around smaller blood vessels in the submucosa and deeper layers, including mesenteric fat (Fig. 17C). The lumen contained mucopurulent or mucous exudate (Fig. 17D). Severe evidence of colitis, with multifocal fissuring ulceration of the mucosa and transmural inflammation (Fig. 17B-17C), was found in these B7RP1-Fc transgenic mice.

The distal colon of the B7RP1-Fc transgenic mice was also diffusely thickened and hyperplastic with elongation, basophilia, and dilatation of the colonic glands (Fig. 18B-18G), some of which contained crypt abscesses (Fig. 18D and 18F) and mucus. The lamina propria had a mild diffuse inflammatory infiltrate of lymphocytes (predominantly CD3+, CD44+ cells, particularly in the superficial mucosa; Fig. 18E), as well as plasma cells and focal aggregates of epithelioid macrophages mixed with some neutrophils. Lymphoid aggregates (of predominantly B220+ cells; Fig. 18D and 18F) were also scattered throughout the mucosa. The small intestine of B7RP1-Fc transgenic mice had more variable changes, including mild to focally marked mucosal and crypt hypertrophy and hyperplasia (Fig. 19B and 19D with crypt/villus ratios ranging from 1:4 to 1.5:1, as compared to 1:10 in the control mice) accompanied by a predominantly lymphoplasmacytic

infiltrate in the lamina propria. The mucosal hyperplasia was most prominent in the proximal small intestine, including the duodenum (Fig. 19B) and particularly the jejunum (Fig. 19D). The crypt architecture was focally deranged and dysplastic in the most severely affected mice (Fig. 19D). In contrast, the distal small intestines (ileum) of some mice, had mild, patchy villous atrophy of the ileal mucosa (Fig. 19F) with blunting, thickening or focal loss of villi (with a crypt:villus ratio of 1:1 or less, instead of the normal ratio of 1:2), while other mice had mild ileal mucosal hypertrophy.

The B7RP1-Fc fusion protein acts to activate cells that are responsible for eliciting a phenotype very similar to that of human Crohn's disease. This indicates that the cells that may be responsible for the inflammation in Crohn's disease are activated by the B7RP1-Fc fusion protein. Soluble protein, antibody or small molecule inhibitors of B7RP1 may therefore be useful in inhibiting IBD.

#### Example 20

The B7RP1-Fc fusion protein inhibits tumor growth in mice

To examine the effect of B7RP1 and CRP1 on the growth of the immunogenic murine Meth A sarcoma, we investigated whether the soluble B7RP1-Fc affects the growth of an established Meth A sarcoma in Balb/c mice.

Exponentially growing Meth A sarcoma cells were implanted by intradermal injection of 0.5 million cells in the abdomen of Balb/c mice on day 0. On day 7, when the tumors reached ~ 100 mm<sup>3</sup>, the mice were treated with either vehicle

(PBS) or B7RP1-Fc (8mg/kg), subcutaneously in the neck on days 7, 10, 14, and 17. The bidimensional diameters of the tumors were measured by calipers and the tumor volume (in mm<sup>3</sup>) was estimated using the formula: Tumor volume =  $\frac{[(width)^2 \times length]}{2}$ . The tumor growth was monitored up to day 28. Each group had eight mice.

The Meth A sarcoma growth pattern of the control tumor was bi-phasic: a slow initial phase was followed by a relatively rapid exponential phase. In B7RP1-Fc treated mice, the growth of the tumor was significantly slower in the rapid exponential phase. On day 28, the average volumes of the control and B7RP1-Fc treated mice were 1410 mm<sup>3</sup> and 580 mm<sup>3</sup>, respectively (Figure 20). Therefore, B7RP1-Fc treatment inhibited tumor growth significantly in this model. The data strongly suggest the beneficial therapeutic utility of the soluble B7RP1-Fc protein, and other activators of the B7RP1/CRP1 pathway, in the treatment of immunogenic tumors.

Immunologic anti-tumor activity is closely associated with cytolytic T-lymphocyte (CTL) function. Consistently, the B7RP1-Fc protein is expressed on cytolytic CD8+ T-cells (Example 9, Figure 6). These data strongly support B7RP1 functions on cytolytic CD8+ T-cells. B7RP1-Fc, or other stimulators of the B7RP1/CRP1 pathway, may therefore be used to enhance cytolytic T-cell and cellular immune functions for a number of non-cancer-related indications.

#### Example 21

Inhibition of human B7RP1 activity in vitro

To determine if human B7RP1 has positive co-stimulatory properties, we tested cells expressing human B7RP1 and human B7RP1-Fc fusion protein in T-cell proliferation assays. The human B7RP1-Fc fusion protein was constructed by fusing gene sequences corresponding to amino acids 1 to 247 to a partial human IgG1 gene sequence (Example 14). The human CRP1-Fc fusion protein was constructed by fusing gene sequences corresponding to amino acids 1 to 146 to a partial human IgG1 gene sequence (Example 2). The methods of construction, expression and purification of both fusion proteins were conducted as described in Example 7. B7RP1-Fc demonstrated co-stimulatory activities that are dependent on anti-CD3 stimulation (Figure 21a). In addition, this activity can be specifically inhibited with soluble CRP1-Fc protein (Figure 21b). Similar co-stimulatory effects were obtained using CHO cells that express membrane-bound, human B7RP1, containing the entire coding sequence (Figure 21c).

The production of cytokines by human T-cells under the above *in vitro* proliferation conditions was determined. Supernatants from T-cell cultures stimulated for 48 and 72 hours were analyzed for IL-2, IL-10, and IFN-gamma by ELISA according to the manufacturer's specifications (BioSource International). The IFN-gamma and IL-10 levels were significantly increased; however, unlike the case with CD28 co-stimulation, IL-2 was not notably induced (Figure 21d). The increased levels of IFN-gamma, a Th1 cytokine, correlate with the B7RP1 functions to increase IgG2a, as described in Example 13.

*In vitro* T-cell co-stimulation assays were conducted as follows. Highly purified human T-cells (>98% CD3+) were isolated by negative

These experiments show that the extracellular portion of human B7RP1, as described

in Example 14, when fused to a human Fc fragment, can co-stimulate T-cells in vitro. This co-stimulation is inhibited by CRP1-Fc and thus demonstrates how a soluble inhibitor of human B7RP1 may function. In vitro assays, such as that described here using human B7RP1 and CRP1, could be used to screen for antibody, soluble protein, peptibody, or small molecule inhibitors of B7RP1/CRP1 activity.

#### Example 22

B7RP1 transgenic mice have increased IgE levels

Transgenic mice described in Example 12 were analyzed for serum IgE antibodies. Orbital sera from B7RP1-Fc transgenic mice and littermate controls were analyzed for IgE by an ELISA protocol. 96-well polystyrene EIA plates (Coster, Cambridge, MA) were coated with 50  $\mu$ l of a 5  $\mu$ g/ml solution of rat anti-mouse IgE antibody (BD Pharmingen, San Diego, CA) in 50 mM  $\text{Na}_2\text{CO}_3/\text{NaHCO}_3$  buffer (pH 9.6 at room temperature for 2 hr then at 4°C overnight. The subsequent procedures were conducted at room temperature. After blocking with assay diluent (1% BSA, 1% normal goat serum, and 0.2% tween-20 in PBS) for 30 min, serum samples and mouse IgE standards (BD Pharmingen) were added into the wells, and the plates were incubated for 2 hr. The wells were washed 3 times with KPL wash buffer (KPL, Gaithersburg, MD). Biotin-conjugated goat anti-rat antibody (BD Pharmingen) was added and incubated for 1 hr. After washing 3 times with KPL wash buffer, horseradish peroxidase-conjugated streptavidin (BD Pharmingen) was added to the wells, and the plates were incubated for 30 min. After the wells were washed 5 times with KPL wash buffer, TMB-hydrogen peroxide substrate solution (KPL) was added, and the plates were

5 approximately three times higher than those in the littermate controls (Figure 22). This increase in the IgE serum levels indicates that B7RP1 regulates IgE expression.

10

The CRP1 gene in mice was disrupted by deleting a genomic fragment corresponding to nucleotides 318-591 of the murine CRP1 cDNA sequence (see SEQ ID NO:\_\_). The murine CRP1 gene was isolated from a 129J library using the full-length (800 bp) cDNA probe (Yoshinaga et al. Nature 402, 827-832 (1999)). The targeting vector, which replaced a 2.8kb genomic fragment with a neomycin resistance (neo) cassette in sense orientation relative to CRP1 transcription, was electroporated into E14 embryonic stem (ES) cells (129/Ola, available from the American Type Culture Collection, Manassas, Va under accession no. CRL-1821). After G418 selection, homologous recombinants were identified by PCR using the primer pair GAG ACT CAT GCT GTG GTT TCA GG (SEQ ID NO:\_\_) and TTC GCC AAT GAC AAG ACG CTG G (SEQ ID NO:\_\_) and verified by Southern blotting. Chimeric mice generated from CRP1<sup>+/-</sup> ES clones were crossed with C57BL6 females to produce CRP1<sup>+/-</sup> mice. Germline transmission of the CRP1 mutation was assessed by PCR and Southern blot analysis of tail DNA. CRP1<sup>-/-</sup> mice generated by the intercrossing of heterozygous offspring were born at the expected Mendelian frequency and were viable, fertile and of normal size. To verify that the CRP1

CS  
5 mutation had abolished CRP1 expression, activated T-cells from CRP1<sup>-/-</sup> mice and control littermates were analyzed by flow cytometry. Upon in vitro T-cell activation, CRP1 was expressed on the surface of both CD4<sup>+</sup> and CD8<sup>+</sup> wild type T-cells, but was undetectable on CRP1<sup>-/-</sup> T-cells.

To investigate the role of CRP1 in T-cell mediated B cell antibody production and isotype class switching, CRP1<sup>-/-</sup> mice and littermate controls were  
10 immunized with 200 µg of nitrophenol conjugated ovalbumin (NP-OVA; Biosearch Technologies, Inc.) adsorbed to alum intraperitoneally. Blood was collected from mouse tails every week following immunization and the levels of nitrophenol (NP)-  
15 specific IgM and IgG<sub>1</sub> as well as the levels of OVA-specific IgE were assessed in the serum.

Titers of NP-specific IgG<sub>1</sub> and IgM antibodies were assessed using sandwich ELISA (Southern Biotechnology Associates) in which ELISA plates were  
20 coated with NP(23)-bovine serum albumin at 50 µg/ml in PBS or carbonate buffer pH 9.2 (Sigma). The arbitrary values obtained by using the SOFTmaxPRO (Molecular Devices) ELISA analysis program were based on the titration curve of the isotype standard used on each  
25 plate. Levels of ovalbumin-specific IgE were detected using an antigen-capture (biotinylated ovalbumin) ELISA method as previously described (Stampfli et al. Am J. Respir. Cell Mol. Biol. 21, 317-326 (1999)). The ELISA was standardized using serum obtained from mice  
30 sensitized to ovalbumin according to a conventional intraperitoneal sensitization model (Ohkawara et al. Am. J. Respir. Cell Mol. Biol. 16, 510 (1997)).

The levels of NP-specific IgM were normal (day 7); however, a significant reduction in the levels  
35 of NP-specific IgG<sub>1</sub> at day 14 and 21 post-immunization,

09728420 11200

indicating that T-cell-dependent antibody production was severely impaired in CRP1<sup>-/-</sup> mice. Furthermore, we observed that OVA-specific IgE were completely undetectable in the serum of ICOS<sup>-/-</sup> mice at day 21 and 28 post-immunization, whereas isotype switching occurred in both heterozygous and wild type control mice, as demonstrated by the presence of IgE in the serum of these animals. (see Table 3). These findings indicate that ICOS plays a role of primary importance in controlling T-B cell collaboration and switching of IgG<sub>1</sub> and IgE isotype classes.

Table 3  
IgE isotype switching in CRP1<sup>-/-</sup> mice

Days post-immunization	CRP1 <sup>+/+</sup>	CRP1 <sup>+/-</sup>	CRP1 <sup>-/-</sup>
Day 21	4/8	5/9	0/7
Day 28	4/6	8/9	0/8

Example 24

Effects of B7RP1 and B7.2  
in a Contact Hypersensitivity Model

In order to induce contact hypersensitivity, female Balb/c mice (9 to 14 weeks old; Charles River Laboratories, Wilmington, MA) were first sensitized by applying a 1% solution of oxazolone (Sigma, St. Louis, MO) in acetone and olive oil onto the shaved skin of the abdomen. Seven days after sensitization, mice were challenged (day 0) by applying the oxazolone solution onto the right ear. The acetone and olive oil solvent was applied at the same time onto the left ear as a control. The thickness of the ears was measured daily

with a micrometer (Mitutoyo, Kawasaki, Japan) starting immediately before challenge. The difference in ear thickness ( $\Delta ET$ ) between right and left ear was used to express the results (McHale et al. J. Immunol 162, 1648 (1999)).

It has been previously observed that administration of B7RP1-Fc fusion protein in this model exacerbates contact hypersensitivity both at the time of sensitization (induction of the primary immune response) or at the time of challenge (induction of the secondary immune response), although the effects are more pronounced when administration occurs at the time of challenge (Yoshinaga et al. Nature 402, 827-832 (1999)).

In order to study the combined effects of B7RP1-Fc and B7.2-Fc on contact hypersensitivity, B7RP1-Fc and B7.2-Fc were given at two different doses either alone or in combination around the time of challenge. At high dose (2 mg/Kg of B7RP1-Fc alone, 2 mg/Kg of B7.2-Fc alone, and 1 mg/Kg of each in combination), B7RP1-Fc, B7.2-Fc, and B7RP1-Fc+B7.2-Fc increased  $\Delta ET$  compared to Fc (2mg/Kg) from day 3 (Fig. 23A). At this dose B7RP1-Fc and B7RP1-Fc+B7.2-Fc increased  $\Delta ET$  more than B7.2-Fc from day 4 (Fig. 23A). B7RP1-Fc+B7.2-Fc also increased  $\Delta ET$  more than B7RP1-Fc from day 4 (Fig. 23A). At low dose (0.4 mg/Kg of B7RP1-Fc alone, 0.4 mg/Kg of B7.2-Fc alone, and 0.2 mg/Kg of each in combination), B7RP1-Fc and B7RP1-Fc+B7.2-Fc increased  $\Delta ET$  compared to Fc (0.4 mg/Kg) from day 4, while B7.2-Fc did not significantly change  $\Delta ET$  (Fig. 23B). Also at this dose B7RP1-Fc and B7RP1-Fc+B7.2-Fc increased  $\Delta ET$  more than B7.2-Fc, and B7RP1-Fc+B7.2-Fc more than B7RP1-Fc (Fig. 23B). Thus, half of full doses of B7RP1-Fc combined with half of full

While the present invention has been

Figure 1 consists of 10 bar charts, labeled (a) through (j), each representing a different variable. Each chart compares responses from 2008 (light bars) and 2012 (dark bars) across five categories: 'Strongly agree', 'Agree', 'Disagree', 'Strongly disagree', and 'No answer'. The y-axis for all charts represents the percentage of respondents, ranging from 0 to 100.

- (a) Age:** Categories are 18-24, 25-34, 35-44, 45-54, 55-64, 65-74, 75-84, 85-94.
- (b) Sex:** Categories are Male, Female.
- (c) Education:** Categories are Primary, Secondary, Tertiary.
- (d) Income:** Categories are Low, Medium, High.
- (e) Employment:** Categories are Employed, Unemployed, Retired.
- (f) Religion:** Categories are Catholic, Protestant, Muslim, Other.
- (g) Political affiliation:** Categories are Conservative, Liberal, Moderate.
- (h) Attitude towards gay men:** Categories are Strongly agree, Agree, Disagree, Strongly disagree, No answer.
- (i) Attitude towards lesbian women:** Categories are Strongly agree, Agree, Disagree, Strongly disagree, No answer.
- (j) Attitude towards transgender people:** Categories are Strongly agree, Agree, Disagree, Strongly disagree, No answer.
